Topic: 17671  Message: 17675

Ok, Harvey, I have to ask: if you are color blind, of what use is it for you to know the insulation colors?

Regards,
Ed

> As usually the little clips that keep the mike in my one working 706MK2G have broken off and I need to replace the 8 pin modular connector on both mikes. I can find the pin outs but no where are wire insulation colors mentioned. So if some one with really good eyes, and not color blind as I am, can please look at their connector and give me a heads up, pin #/color I would appreciate it. So would, I am sure, a bunch of other folks with the same issue.

Hi folks, i have a friend who I talk withh almost nightly.
Over the past weeks his audio has started sounding scratchy and he says it should the same way on his receive, almost like its static

Any suggestions? Know problem?

Thanks

# 17677. RE: [ic706] 706 mk22 has intermittentt scratchy receive and transmit audio

I have a similar intermittent instability problem with my IC-706 MKII in a mobile setup. It also appears as a rough/scratchy CW transmit note. The rig will also independently switch from receive mode to transmit mode - as if PTT were pressed. Sometimes the rig will reset itself, otherwise I power off/on (sometimes multiple times) to reset it. I haven't been able to isolate the problem though. Voltage, temperature, vibration don't seem to be the cause(s).

I too would appreciate suggestions.

I think this is a unusual problem you have. The only thing I can think of is a noisy mic switch. What's weird is I believe you said you could hear it coming from the transmit radio as well, that's more like rfi. Make sure you do not have a intermittent antenna or feedline problem. Maybe you can monitor swr while this is happening.
That's about all I can think of. Mike

Hello Friend. I've need some help about the LCD display fron IC706 classic version. I've contact the ICOM america and ask about the part number 5010000171(LCD DISPLAY). But I'm in Brazil and they cant send it to me. I ask if some friend in the United States can help me buying this part end send it to me and I will pay out by PayPal.

Many thanks

# 17687. antenna connector

Yahoo group: ic706 (2010 — 2015)
Date: 2010-01-08 22:35:45 UTC
From: hambeemer
Topic: 17687  Message: 17687

I have the icom 706mkii. The connection part for the coax from the antenna is broken. The part has the cable with some small connector that attaches to the pc board for the HF side of the radio.

Where can I order parts for the radio? Icom or after market stores?

This radio has served me well in the past 8 years. In that time its been on 3 BMW motorcycles. Vibrations and being outside in the cold, rain, and heat of summer and it worked great! However the vibrations did take its toll on the connection for the antenna. I have had it on the beemers and amassed over 130,000 miles! Hope to repair it and install it for this coming summer rides to the East coast as well as the west!

73 and stay warm!

Hello,
I have a Ic-706 that has no receive or transmit. The radio will come on and do everything else fine, and the volume works as you get sound on fm and a little on the other modes. When you press the ptt button the radios tx relay clicks and the light moves to tx, but zero power out. I really appreciate any thoughts you guys might have on the possible cause. Thanks so much.

Have you had it apart and looked at the circuit from the center of the coax plug to the circuit board and into the antenna tuner? Has lightening been involved?

Check IF antenna is getting connected  with  radio OR Check  IF there is a fuse between antenna connector and radio. Look for this fuse inside radio near antenna connector.

Looks as if antenna is not getting connected with radio from inside radio.

Thanks for the ideas. I have had the radio apart and everything looks good on both of the coax lines from the S0-259s to the circuit boards. I have tried the radio in every mode to see if there is output. The meter on the lcd doesnt ever move at all in any mode. Also, if i i put it on a frequency and transmit with another radio right beside it, it does not pick it up at all. So it is 100 percent dead on both tx and rx. And i dont know if lightning was involved or not. Im wondering if something in the PLL circuit could be causing this??. Thanks again. Oh and the one fuse i found is good.

Hi, my original 706 did this on the vhf ranges - I did not check it on HF, but I found the problem was water had got onto the upper board and shorted/ corroded around the pll tin can area. If the pll is unlocked, the transmit power is inhibited however I recall the display still indicates TX mode.

I was very lucky to be able to clean this off with CRC 2-26 and the radio has been working perfectly since 2 years ago. I dont let water get in again!

# 17698. Digital Modes - Recommended Interface - Advice ??

Yahoo group: ic706 (2010 — 2015)
Date: 2010-01-10 22:22:49 UTC
From: Larry J. Ford
Topic: 17698  Message: 17698

I'm looking at getting into the digital modes, which I must admit I'm rather confused by [1], and wrestling with the proper interface device to use with:

1. Primarily, an ICOM 706 MKII (for base/mobile/portable use); and/or

2. Secondarily, a Kenwood TS-870S for base use only. (Note: I do have the Kenwood factory RS-232 interface device for the TS-870S)

I "think" my choices have been narrowed down to:

1. The "Signalink USB" from Tigertronics;

2. The West Mountain Radio "RIGblaster Plug & Play" (which has the added advantage of acting as a CI/V control interface for the 706, as I understand it); and,

3. Building the soundcard interface kit for "FL Digi" and other modes featured in QST back in the summer of 2009. I have the kit, but haven't built it yet.

I also have an old (20 years +-) Kantronics KAM that I recently bought from the estate of an SK, but don't have the original software for it (although I do have the manuals). It appears to be more complicated to use than one of the more modern interfaces listed above, and is no longer supported in any way by Kantronics.

As far as software that I "know" I'll want to use, that would be WinLink, which has pretty much been adopted by NC ARES for EMCOMM use. I'm involved with ARES in NC.

Any advice, comments, recommendations from those of you who are experienced digital operators?

Thanks and 73,

Larry J. Ford

Larry,

I use the SL usb version with a 706IIG, a 7000, an Elecraft K3, and a Kenwood 480 before I sold it. It has it's own sound card. That way, you set the software to use it instead of the computer card. By doing that, the "microsoft" sounds won't get transmitted if you forget to turn them off. Also, the levels are knobs on the SL, so it is easy to set. This unit will work with just about any radio. The jumper settings are easy to change if needed. This unit will also control the transmit on all those radios so a serial control isn't needed. Highly recommended. Follow Signslink's instructions and it's a breeze!

73,

Carl

AB1DD

Resistance is futile.

(don't know about reactance, though)

I'm looking at getting into the digital modes, which I must admit I'm rather confused by [1], and wrestling with the proper interface device to use with:

1. Primarily, an ICOM 706 MKII (for base/mobile/ portable use); and/or

2. Secondarily, a Kenwood TS-870S for base use only. (Note: I do have the Kenwood factory RS-232 interface device for the TS-870S)

I "think" my choices have been narrowed down to:

1. The "Signalink USB" from Tigertronics;

2. The West Mountain Radio "RIGblaster Plug & Play" (which has the added advantage of acting as a CI/V control interface for the 706, as I understand it); and,

3. Building the soundcard interface kit for "FL Digi" and other modes featured in QST back in the summer of 2009. I have the kit, but haven't built it yet.

I also have an old (20 years +-) Kantronics KAM that I recently bought from the estate of an SK, but don't have the original software for it (although I do have the manuals). It appears to be more complicated to use than one of the more modern interfaces listed above,

and is no longer supported in any way by Kantronics.

As far as software that I "know" I'll want to use, that would be WinLink, which has pretty much been adopted by NC ARES for EMCOMM use. I'm involved with ARES in NC.

Any advice, comments, recommendations from those of you who are experienced digital operators?

Thanks and 73,

Larry J. Ford

Hi Larry,

My recommendation, don't even waste money on a interface unless you absolutely have to have a separate sound card. The Accy connection on the back of the 706 can take care of all your audio in and out. I have cables going from the audio out and audio in of the accy jack straight to the computer sound card. I am sure there are some here that say you just have to have isolation from ground between the computer and the radio but I haven't found that to be the case. Now I have found that to be the case if you are going to try and use the mic jack, but on the several HF rigs I have owned in the past few years, as long as I have used the accy jack on the rear of the rig I haven't had problem one. I guess if you want the knobs to adjust levels instead of the software sliders then by all means get that fancy interface.

So all you really need is a cheap CIV cable off of Ebay, or other places, for rig control and PTT, a din plug for the accy jack on the back of the Icom, and a few connectors for plugging it all in to your sound card. You will probably spend a whole 20 dollars on the whole thing. Heck of a lot cheaper than the 100 dollars plus those commercial interfaces are going to cost you. If you already have an auto tuner connected to the accy jack on the back of the rig you can just add some pigtails and connectors to the existing din plug and it won't interfere at all with the auto tuner. Give me a shout if I can help you out in any way. I am good on QRZ.

# 17701. ICOM IC-7200

Yahoo group: ic706 (2010 — 2015)
Date: 2010-01-13 03:51:23 UTC
From: Larry J. Ford
Topic: 17701  Message: 17701

Anyone on the list using or familiar with the IC-7200?

I'm thinking of selling/trading a Kenwood TS-870S I've been using for my base rig and getting the 7200 for use as a base rig (with the added benefit that the 7200 is more "field-deployable" than the TS-870S).

Comments and reviews based on operating experienced appreciated.

By "build one like hams did in the old days," are you referring to kits like I mentioned in my original posting?

> 3. Building the soundcard interface kit for "FL Digi" and other modes

>

Of course, that's only good for sound card mods, and not exactly a TNC like the SCS units.

Is there a good kit for a true TNC comparable to the SCS units?

You can build one complete with C-IV interface with plans on the web... I have that includes keying and *could* include C-IV if I wanted, but I already have the Icom one, so I never included it. VERY simple to put together on your own...

Joe,

Always keep in mind that "... VERY simple ... " to you is probably like brain surgery or rocket science to someone like me!

If there is a kit that I can order, with a pre-printed circuit board (thru-hole) with clear indications of where the components go, which includes all the necessary components and instructions (pictures preferred), so that all I have to do is put the components on the board, dress the leads and solder it up, then that's approaching the "... VERY simple ..." stage for me!

Where can I order a kit like that which will do what you mention below?

I have for sale 2 of the 3 pieces for the 706 separation kit. I have the mobile mounting bracket (with screws) and the separation cable, but am missing the faceplate bracket. This might be enough for your remote mounting, depending on how your setup is. You can buy this piece by itself, also.

I am asking $32/BO shipped in the US and can take paypal/check/MO.

I have an older 706MKIIG and the FM mode has quite working. No FM on any band. SSB works fine. Anyone know who to send the radio to for repair and a ballpark figure as to cost. I have had this radio for about 8 years. I has spent its life in an 18-wheeler with the radio body in a plactic tray lying on the floor of the closet. This thing has had a hard life and has over 1 million miles on it, but it just keeps on working (almost). I hate to get rid of it.

Did you do a reset on the radio?
Make sure you are not in FM wide.

I have an ah4 hooked up to my icom 706 mkII with a wire that is abt 43ft long the tuner was working and now when I press the tune button it will not lock in swr and the tune light goes out. apparently its not finding a good swr now. any help would be appreciated.

# 17720. Need a source for filter relays

Yahoo group: ic706 (2010 — 2015)
Date: 2010-01-30 13:53:27 UTC
From: w2wht
Topic: 17720  Message: 17720

Hi, I am new to the group and obtained a nice 706 original model.
I have two of the filter relays that are not completing the circuit and the unit is deaf on 160 and 12-10 meters and will not transmit on those bands. Everything else works perfectly.
I think I can solder new relays onto the Filter board. I need at least two, and probably should get a couple extra if they are not expensive. If these relays are "common" I will skip the last part.
Anyone know where I can get these?
Thanks for the support...

When you say a "wire that is abt 43ft long" do you mean you don't have the 706 tuner port connected to the AH-4 via the standard control cable?

Double-check all your connections. Make sure the antenna & control wire is in one piece, and your ground is still good. Make sure the coax is good as well. Could be a tuner issue of course, but verify all the other external stuff first...

Joe, N3JI

# 17736. Re: [ic706] icom 706 mkII and ah4

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-01 03:02:40 UTC
From: kevin tischler
Topic: 17719  Message: 17736

Here you go... since you know it all.... a copy of my original advanced class license.
Obtained 7/22/98, expired 5/14/07. Renewed to expire 5/14/2017.
I am sorry guys on the reflector, who cannot see the nocode general's banter on
direct email. These emails are not what the reflector is about. I am tired, I have to work
tomorrow, and I am blocking this guys emails from now on. I will not see them direct
or in the reflector due to the spam filter looking for his name and callsign will delete
them
before I ever see. I regret this had to be on the reflector, I was trying to help the guy
out
but he could not see it. If I have been a problem, just remove me from the reflector, I was
only trying to help the (ahem) gentleman out.

signed
CODED, and still performing 13-18 wpm!

-.-'---

From: Joe Isabella
Topic: 17741  Message: 17742

You can't swap heads, but I *think* the LCDs are the same.

I have the service manuals from both -- if someone doesn't check me before I can look, I'll let you know.

You can use an IC706 MK2g head on the original IC706.

You can use an original control head on an IC706 MK2g.

There are some functions that do not operate correctly, however, it does work. I have both radios and have exchanged control heads sometimes. The most noticeable difference is the function of the rotary encoder RIT/memory knob on the 2g. A 706 controller on a MK2g will slew the memory channels at about 400 per turn so selecting a specific channel is tricky. the up/dn buttons still work the same, so no problem. I dont think my DSP worked using the 706 controller either, as there was no submenu available for a DSP board that hadnt been invented yet.

Ralph

# 17745. 706Mk2G powers off when keyed

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-09 12:16:26 UTC
From: n4xd
Topic: 17745  Message: 17745

Was working fine. Now whenever keyed (no power out) turns off.
I've tried it with 3 different power supplies capable of over 20A out so pretty confident not a power supply problem. Power connector in back and on rig are clean and fitting tightly.

Anyone have any idea on what might be wrong?

Thanks
Ron

I have for sale a Samlex 1223 switching type power supply that does 13.8 volts at 23 amps. Perfect for powering an HF radio or VHF/UHF brick amp. This is a light weight, fairly small switching power supply that works fine. Its small size and weight makes if perfect for both home station use and also to take portable. Condition is pretty good also. These sell new for $99 plus shipping, I am asking $67 shipped and can take paypal/check/MO.

Did you try it in different modes and with reduced power out?
Did you try checking with a volt meter with sharp insulating piercing tips AT the radio end to make sure it is not some kind of fuse or cable problem?
Try backing the power WAY DOWN to see it will stay powered up.
I assume it does this on both HF and UHF/VHF.
Good Luck,
Ron W8RJL

Subject: [ic706] 706Mk2G powers off when keyed

Was working fine. Now whenever keyed (no power out) turns off.
I've tried it with 3 different power supplies capable of over 20A out so pretty confident not a power supply problem. Power connector in back and on rig are clean and fitting tightly.

Anyone have any idea on what might be wrong?

Thanks
Ron

Have you separated the panel from the blackbox? If yes, CLEAN theese
connectors !
I have to do that every 6 months.

Even without the separation kit installed, it can have connection issues. My Original 706 had power up issues and the contacts were the problem (no separation kit).

also clean the contacts between the head and the radio. Don't scratch
off the gold plating. Clean with alcohol on a Q tip.

Thank you all for the tips. Turns out that even though the gold contacts on the front of the rig and the front panel looked very clean after cleaning them and reconnecting the front panel it all worked FB. Thanks again!

Hello all,

I know I have not been very active in the group with postings. However I have been reading the many post that has come out and they are very entertaining and educational however I have noticed that 98% of the post surround the newer versions of the 706.

Have you guys forgot about the 706 1st version (no suffix). I mean there are guys out there that has this radio, such as myself.

I ask and implore those out there that has this radio to post about the things that they have come across, and put some things in the Files and links.

I mean I love this radio.

One great thing about the 706 original compared to the newer models is that the original had the fan running all of the time.

What's to say? They work FB. Mine has been bolted behind the driver's seat in at least 3 pickups. It spends a fair bit of time driving off road, and has survived one of the pickups being totaled in an off-road mishap.

I have to leave the screw off the end of the extender cable as it shorts something out, but that hasn't been a problem. I did have to clean the contacts on the extender cable once, and I drilled a small hole in the front of the mic, right opposite the mic element.

Regards,
Ed - N5KZW

Many of the questions/comments are from new 706 users/purchasers. Since the original 706 is not on the market it would be logical that more questions will arise out of the use of the G model as opposed to the original model.

There is a dedicated 706MKIIG Yahoo Group, of which I am also a member even though I sold my MKIIG to get my 7000. I don't know which group is older, but this is certainly the place to post questions, issues, etc. about the Original 706. It sounds like someone gave you the impression otherwise. A lot of things apply to all versions, others are specific to each. But either way, all 706 related posts are welcome here. I've never seen anything to the contrary.

To make matters worse, there are actually TWO "G" groups

IC-706MkIIG and IcomIC706mk2g

--73, Steve, K9DCI

P.S. SO how to slice it?? This group is for any version or just the vanilla 706? They all are dwindling as time passes.
No 706MkII Group (that I kow of)

Whatever...

From: nb7o
Topic: 17756  Message: 17766

I concur with all comments to my reply. I merely wanted to point out the many new users to the 706 are mostly going to get the G model and so a disparate number of questions will be about the G. Didn't mean to imply that questions on any model should not be posted. I own one of each of the three models. Considered trading one for a new 7000 and then asked myself why. I like the 706. I know many of its quirks. So why get something else. I may someday but cant see why now.

Lee - you are luckier than I am. My wife says that she looks for new models of husbands as often as I look at new radio gear and computers. I try to point out that one is an occupation. She replies that raising me has been an occupation too. Oh well.

From: John Geiger
Topic: 17756  Message: 17767

So how do all three models compare?  Which is the best overall for HF and 6m performance? I have a MKII model that does good on HF and 6m and actually seems to be about the right level of sensitivity for HF.  The MKIIG seems almost too sensitive.

# 17768. FS: Icom 706MKII

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-15 03:10:08 UTC
From: John Geiger
Topic: 16082  Message: 17768

I have for sale an Icom 706MKII HF/6m/2m transceiver in very good condition. This is the model that does 100 watts on HF and 6m and 20 watts on 2m. It works very good and looks very good also other than 1 small mark on the top of the case on the right side. It has the UT-106 DSP unit installed for the noise reduction and autonotch features. I have had a couple of 706MKIIs before and this is probaby the best operating one I have seen. It comes with the hand mic, short power cord, and operating manual.

I am asking $450 plus shipping for it. I can take paypal/check/MO. Hate to sell it but I am replacing it with another rig that also does 70cm SSB for VHF contesting and the SSB satellites.

# 17770. Re: IC 706 NO Suffix

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-15 17:08:08 UTC
From: nb7o
Topic: 17756  Message: 17770

My favorite is the G model. It is easier to program. I find the sensitivity between the II and IIG models to be about the same (at least for my radios). My xmit levels seems to be a bit stronger on the non-G model. But just ever so slightly. None have been in for repair.

# 17771. Re: [ic706] Re: 706Mk2G powers off when keyed

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-15 16:39:33 UTC
From: Larry J. Ford
Topic: 17745  Message: 17771

I guess the old adage about starting with the "simple solutions" first continues to have merit.

I had a similar problem with an amp relay cable caused by one or more pins in a DIN plug not making good contact in the socket on the rig side. The DIN plug pins had "splits" where a thin Exacto knife blade could be inserted and wiggled just enough to spread the pins out a bit, allowing tighter contact in the socket.

I bought one of those cheap GPS suction cup windshield mounts, did a little trimming on it and used hook and loop tape to mount the head on. Works fairly well, I don't leave it in the vehicle full time but it works great for vacations. I think the local Walmart or Target has them for less than 15 dollars or so.

My solution was to bend a piece of aluminium into an L shape and fix the head mount to it. Sprayed black it slides in over the central cup holder on my Discovery and allows me full control with my hand resting on the gear stick. On it's own it's not too elegant but it works well and is a comfortable operating position when driving.

# 17775. FS: Icom FL100 CW filter

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-17 19:44:53 UTC
From: John Geiger
Topic: 14516  Message: 17775

I have for sale an Icom FL100 500hz CW filter that fits in the 706/725/728/736/737/738/746/756/775 series of radios. It will not fit in the 703/707/718 radios as those take the 455khz IF filters. I am asking $60 shipped for it and can take paypal/check/MO.

From: kd8dvy@ymail.com
Topic: 17756  Message: 17776

Sorry it took so long for me to get back to the group since my original post I have had internet issues. Anyhow I was asking that question and making that statement cause I wanted to know if anyone has done a mod to get 60M out of the 706 no suffix?

That was the reason for the original post.

> I concur with all comments to my reply. I merely wanted to point out the many new users to the 706 are mostly going to get the G model and so a disparate number of questions will be about the G. Didn't mean to imply that questions on any model should not be posted. I own one of each of the three models. Considered trading one for a new 7000 and then asked myself why. I like the 706. I know many of its quirks. So why get something else. I may someday but cant see why now.

# 17777. Re: suction cup mount

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-19 00:56:00 UTC
From: EdwinB
Topic: 17772  Message: 17777

Does your truck have a flip down center console/arm rest? Mine does, and I bent a piece of galvanized steel to fit under it and up the front. The mounts for the 706 and the dual-band remote heads attach to the steel and are usable with an arm resting on the arm rest. Sections of the hook side of Velcro pairs are glued to the inside of the steel, and a single piece of small stuff tied around the steel and the console keep everything in place. If I'm carrying a third passenger, the center console flips up.

Regards,
Ed - N5KZW

It should be fairly easy to fabricate one from some scrap metal. Just be very careful to use the proper screws in the threaded holes in the side of the 706 paying careful attention that they don¹t go in too far.

# 17781. Oscillation problem on 15m, need help

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-21 17:58:56 UTC
From: dk5ec
Topic: 17781  Message: 17781

I need some help with a RF problem of my IC-706MKIIG: when tuning my matchbox for 15m with the IC-706MKII in RTTY mode, everything looks normal. When I switch to USB mode, and then start talking, sometimes the power level goes up to full power, and the SWR to undefinitely high.
Apparently, the transmitter sends suddenly the full power on a frequency somewhere above 11 MHz, but not on 21 MHz. Sometimes I can work normally on USB, but I have to watch constantly the Power/SWR meter because any time it may start oscillating on 11 MHz again. The same thing happens also when connecting to a dummy load.
First I thought it could have been a RF feedback on the microphone line, but when using a dummy load, this is rather unlikely. The same sympton occurs on 18.1 MHz. On all other bands, the rig just works fine.
Any help would be greatly appreciated.
73, Karl

I have a bunch of extra RJ45 plugs for the mic connector, I also have the proper crimping tool. Were you just wanting an extra hand mic. I think I have some old CB type stock mic's in a box here somewhere. I can wire one up for you and send it to you if that is what you are needing. Just let me know here either on the list or off the list.

Hi.

I have a secondhand MkIIg. All works fine for me but is seems that the set was originally supplied for the USA?

The automatic repeater shifts are: default values
2M
145.200 to 145.875 DUP-
146.6125 to 146.9875 DUP-
147.000 to 147.3875 DUP+

70cm
442.0125 to 444.9875 DUP+
447.000 to 449.9875 DUP-

I am in the UK so is there any easy way of changing these?
The TX has been widebanded

Thanks

Steve

The default offset is 600kc If you want it to be something else it needs to be changed in the setup menu. I'd have to go read the owner's manual to refresh my memory on how to do that but then again you can read it there also. If you don't have the manual just go to Icom's web site under support or services or downloads and download the manual.

Hi

Its not the SHFT that is the problem its WHERE the shift is applied automatically by the VFO.

I amd in the UK and the repaters shift of 600khz is from 145.600 to 145.7875 BUT my mkIIg applies it to 145.200 to 145.4875 (and 146.6125 to 146.9875 and 147.000 to 147.3875) . I have the correct shift but at the wrong frequencies!

The shift for applied for 70 cm is also incorrect and includes out of band frequencies in UK.

I have the serial and this ties in with the serial # on the box ie 007794
and this shows #12 (EUR) and showns intended countries as
GER/AUT/GBR/IRL/NED/LUX/SWE/DEN/FIN.

# 17790. Re: [ic706] Re: mkIIg repeater shifts

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-23 22:48:25 UTC
From: Joe Isabella
Topic: 17784  Message: 17790

Auto-repeater function only works for the US bands. Per the manual:

This function automatically activates the repeater settings
(DUP+ or DUP– and tone encoder ON/OFF)
when the operating frequency falls within the general
output frequency range and deactivates them when
outside of the range.

Set the auto repeater function ON or OFF in initial set
mode in advance (p. 53). When set ON, repeater settings
are automatically activated according to the
table at right.

NOTE:This function is available for the USA version
only.

From: Bob Reiff
Topic: 17784  Message: 17792

Is it possible the unit, even though it says it is a EUR model, has been changed (modified) into a US model by removing or adding some jumpers? Maybe wide banding it also forces it into USA mode?

From: Greg
Topic: 17784  Message: 17793

While I'm only a satisfied user, it would seem to me that some engineer/designer person made it like it is, then another could re-do or change the paramaters. The effort to do so may easily outweigh the benefits however. I feel it is worth a look though to discover what changes constitute a EUR model from a USA model.

# 17794. Re: Oscillation problem on 15m, need help

Yahoo group: ic706 (2010 — 2015)
Date: 2010-02-24 06:46:29 UTC
From: kj4du
Topic: 17781  Message: 17794

This is an old problem with the MKIIG, I believe it affects only the earlier models and I had this problem with mine and struggled with it. The problem is that, when the low-pass filter for 15M and 17M is switched in, the PA is not unconditionally stable around 11 MHz. It will break into a full power oscillation if your matchbox reflects a low capacitive reactance back to the antenna terminals near 11 MHz.

Icom published a Technical Bulletin #928, adding a spring to ground a certain point on the PA board to the chassis. You can find this bulletin posted on the web. Also clean the metal on the cover where the ground springs of the PA board contact the covers. Apparently this fixes many of the units. However, these changes still did not completely solve the oscillation problem with mine.

As a last resort I added about 3.5 meters of coax cable between the transceiver and matchbox to rotate the reflected impedance from the tuner to a different value at 11 MHz. The exact length of coax is not critical and you can roll it up. This completely solved the problem.

Good luck, except for this problem it is a fine little radio.

From: Lefczik, Larry D
Topic: 17756  Message: 17795

Removal (destruction) of the diode (D64 I believe) opens transmit frequency range for the original 706. Program 5 memories for the appropriate channels. Works great.

Sorry it took so long for me to get back to the group since my original post I have had internet issues. Anyhow I was asking that question and making that statement cause I wanted to know if anyone has done a mod to get 60M out of the 706 no suffix?

That was the reason for the original post.

Didn't mean to imply that questions on any model should not be posted. I own one of each of the three models. Considered trading one for a new 7000 and then asked myself why. I like the 706. I know many of its quirks. So why get something else. I may someday but cant see why now.

I don't know which group is older, but this is certainly the place to post questions, issues, etc. about the Original 706. It sounds like someone gave you the impression otherwise. A lot of things apply to all versions, others are specific to each. But either way, all 706 related posts are welcome here. I've never seen anything to the contrary.

Thanks to Mike and K4DU my oscillation problem has been solved completetly. Mike's advice to tighten the screws helpe to some extent, but with bad SWR values ist startet oscillating again. With the an additional cable betwenn the rig and the matchbox (and amplifier) the problem was completely solve. Nor mor oscillations, also with bad SWR.
Thanks again to both of you.

# 17797. 706 CI-V Failure

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-01 06:03:16 UTC
From: n3lka
Topic: 17797  Message: 17797

Hello, has anyone ever had their ci-v port fail on the IC-706. I know the interface is good, I have 2 interfaces and tried both. The address and communications are set correctly, and I checked it on two different pc's.

I checked the continuity from the connector in the back to the main board of the 706 and it looks good. Unfortunatley the service manual I have is a copy and where the ci-v circuit winds up isn't clear.

At this point the radio is my mobile and a back up rig, and the ci-v isn't that important. I'd just like to know if anyone else has had the same issue.

In the meantime I'll try to find a better copy of the schematics.

73,

Brian

Hi Brian,

Mine failed, I was sure I'd documented it but looking through the archives I can't see any reference to it. Anyway, a track had burnt out very close to the socket, it was obvious to see and I think I was able to bridge it without too much of a strip down. It was back up and running quite quickly even with my dodgy soldering. Never did find out the cause but it ran on the same interface for some time after until I sold it. One way to check if it is the socket, plug in a shorted 3.5mm plug, (I think I actually used a pair of headphones) and see if you can enter the alignment menu. If you can't it's a safe bet the sockt is o/c.

Mine has also failed, and I found it to be a component (SMT diode I think). That radio is also a backup for me, but at the time, I was using it in the shack during a contest with an amp. And I was running a dipole with a tuner and had a lot of RF in the shack. Turns out there was enough on the remote line to pop that little diode. x(

I haven't fixed it yet, but I remember having difficulty reading the scanned SM as well.

Subject: [ic706] 706 CI-V Failure

Hello, has anyone ever had their ci-v port fail on the IC-706. I know the interface is good, I have 2 interfaces and tried both. The address and communications are set correctly, and I checked it on two different pc's.

I checked the continuity from the connector in the back to the main board of the 706 and it looks good. Unfortunatley the service manual I have is a copy and where the ci-v circuit winds up isn't clear.

At this point the radio is my mobile and a back up rig, and the ci-v isn't that important. I'd just like to know if anyone else has had the same issue.

In the meantime I'll try to find a better copy of the schematics.

73,

Brian

I finally found a good pdf last night, so I'll look that one up. I haven't had the remote hooked up since I moved and I'm only running 100 Watts, so I don't know what would've caused mine to go. I'm having trouble remebering if I used mine before, I think I did...lol, getting old stinks, and I'm not even 50 yet.

Brian

Thanks, the socket's good. I traced it back to the main board where it comes off of the ribbon cable. I was hoping for a quick fix like that last night when I had it opened up.

Thanks,

Brian

Hi Brian:

Just a quick thought..... did your setup menu in the Icom get changed somehow?
I mean specifically baud rate and CI-V address. Computer programs are looking for a specific baud rate, such as 9600 and
CI-V such as 48h. Go to the set up menu items ( power and lock, together ) to check items 34, 35, and 36 to make sure they are correct for your application.

Hope it's that simple for you, let us know,

Richard VA3NDO

# 17806. Upgrading 706mkll

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-02 03:58:29 UTC
From: John
Topic: 17806  Message: 17806

I'm thinking of replacing my 20 year old Yaesu FT890AT with a newer rig. I upgrade my older HF rig about every 10 years. I have an IC706mkll that I'll keep for mobile use. I'm currently trying an IC7000 that appeals, but I want to know more about the IC7200 before deciding. I'm not concerned about the lack of vhf and fm and the size of the one. I'm more interested in receive/transmit comparisons and ease of operation. I'm looking towards a new rig being more of a home station, some contesting, and field day type operations. It appeaars both rigs are within $200 of each other new. I will probably hold off a purchase until Dayton deal days unless I hear of someother fantastic deal before then.

Is someone with experience with both rigs willing to share your thoughts about each with me? It's down to deciding between the two.

TNX in advance for any guidance. WA8KIW

# 17807. Re: [ic706] Upgrading 706mkll

From: Larry J. Ford
Topic: 17806  Message: 17807

I got a new 7200 about a month ago and like it. It replaced a Kenwood TS-870S, and complements my two other rigs, an "original" 706 and a 706 MKII.

It will be an easy transition to the 7200 if you're familiar with the 706. Not as much button pushing and "menu" diving to get the rig to do what you want, but what menus there are very similar to the 706 series.

The 7200 basically has the IF DSP and filters of the higher-end ICOM HF rigs, but is more "field deployable," which is good if you're into EMCOMM work (I'm involved with ARES in NC). A big plus is the USB port, which I don't believe the 7000 has.

For me, the 7000 just wasn't worth the extra $$$, as the 7200 does all I need in an HF/6 meter rig, and I have the 706s for VHF work.

There is a 7200 Yahoo user group that you might consider joining and asking questions there.

# 17808. '706mkIIG F/S

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-02 22:59:59 UTC
From: KC6STT
Topic: 17808  Message: 17808

Hi.

I have for sale a used, but not abused, '706MKIIG for $500 + ship (I estimate abt $15). It is about 7 years old and has been used as both a base and mobile. The radio is a 7/10 cosmetically. It has a cracked volume knob and a few minor scratches on the tranceiver unit, but is otherwise undamaged.

It will include the moble mounting bracket and original hardware, a 5 foot long power cord (fuses intact), the remote mounting kit hardware, a remote microphone cable with mountable jack (abt 12 feet long) the original mic, and a DTMF mic.

The radio is 100% fuctional with no display issues or bad LEDs. It has no loose connectors, etc. The 60 meter mod has been done to it, but no other mods.

The radio has been a workhorse. Never had an ounce of trouble with it. I've recently purchased a '7200, and the '706 is now surplus.

Please reply to KC6STT@....

Stacy

Hello all I am having major issues with my 706 no suffix. I need help bad!!!

I lost the SWR meter some kind of way and now I can't tell if I have good or bad SWR. I do have a tuner that has cross needles but I would love to have my meter back.

Also I need help with aligning the TX on the radio but I don't have all of the equipment that the manual ask for you to have. Is there any ideas as what I can do?

What are folks who run PSK31 or other soundcard-based digital modes using for an interface device with a 706 (either an "original 706" or a 706MKII)?

Is the Signalink the recommended device?

What about a CI-V rig control interface (other than the expensive ICOM device)?

Thanks,

Larry J. Ford

Hi Larry,
I have two IC-706MIIG's and one IC-7000.. I run the Signalink on all 3... Plus it also works on my IC-208H and my wifes IC-207H.
For my CAT needs I picked up a scanner control cable from RadioShack. You can find them on sale sometimes and tons cheaper than Icoms CT-17 C-IV set up.. Its a easy hookup and all the drivers come with it.. There are lots of options out there as I am sure you will hear... But I think you will not go wrong with the Signalink.... I have had my 1st on for over 3 years now.. Not one bit of trouble.. Good luck to you and hope to see you on the waterfall on PSK-31 someday.. Its my favorite mood so far.. But I am also trying RTTY, Also fun... You will get some great advice here.. Good luck to you.

Topic: 17819  Message: 17821

Dan,

Thanks for the info. I'm looking at the Signalink for the 706s for potential portable use.

I also have an ICOM IC-7200, which needs no interface, simply a USB cable from the PC to the rig. I've been running PSK-31 on the 7200 with HRD/DM780 for a few weeks now, and really enjoy it.

However, although the 7200 is certainly "field-deployable," I don't think I'm going to be taking it on camping trips and the like; hence, my interest in getting one of the 706s up and running on soundcard modes.

I may see you on the waterfall sooner, rather than later!

73,

Larry J. Ford

I have two IC-706MIIG's and one IC-7000.. I run the Signalink on all 3... Plus it also works on my IC-208H and my wifes IC-207H.
For my CAT needs I picked up a scanner control cable from RadioShack. You can find them on sale sometimes and tons cheaper than Icoms CT-17 C-IV set up.. Its a easy hookup and all the drivers come with it.. There are lots of options out there as I am sure you will hear... But I think you will not go wrong with the Signalink.... I have had my 1st on for over 3 years now.. Not one bit of trouble.. Good luck to you and hope to see you on the waterfall on PSK-31 someday.. Its my favorite mood so far.. But I am also trying RTTY, Also fun... You will get some great advice here.. Good luck to you.

Subject: [ic706] Recommended Soundcard Mode Interface for 706

What are folks who run PSK31 or other soundcard-based digital modes using for an interface device with a 706 (either an "original 706" or a 706MKII)?

Is the Signalink the recommended device?

What about a CI-V rig control interface (other than the expensive ICOM device)?

Thanks,

Larry J. Ford

Hello Larry,

As you know, there are dozens of choices for sound card and CI-v control. I tried a few of the commercial products when I was first licensed, and they *do* work.. However, many do not offer full compatibility with the available software. For example, most interfaces will handle audio transformation and PTT for PSK31 and other digital modes, but do not offer COS for operation such as Echolink. Some require your radio to use VOX mode, rather than use the actual PTT circuit.

A similar thing occurs with the pricey CT-17 interface for CI-v. It is a well-built interface, but as built is not capable of any operation besides Icom. A simple rewiring would allow operation of Yaesu radios, EF Johnson, GE, etc.

My solution was to homebrew a Rigblaster-type interface that includes COS and build a homebrew version of the CT-17. The CT-17 uses a MAX232 IC, which is fully RS-232 compliant. The Rigblaster-type interface uses a 4n25 optocoupler for PTT and real audio transformers, rather than the tuned circuit approach used in the cheaper radio/sound card interfaces. About $20 would cover the cost of all parts needed for both interfaces. Schematics are available on my web site:
http://www.qsl.net/k0kn

73 and good luck,

Kyle
K0KN

# 17824. Recommended Soundcard Mode Interface for 706

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-25 18:17:00 UTC
From: David Bartholomew
Topic: 17819  Message: 17824

I've been using the Rigblaster USB from West Mountain.
I don't use the rig control functions although it supports them. You can use it with a lot of different software for doing different digital modes.

Hi Rich here,

Is the power cord on the Mk2G the same as the Kenwood and Yaesu. I know my TS50 will work with my 857 cord as I checked the cables and the molex is the same with the same pattern. I am curious because the manual shows the same molex but no pinout diagram. Tnx Richy N2ZD

From: jb
Topic: 17825  Message: 17828

Hi Rich,
I noticed that the power chord for my 'g' was larger (fatter) than that of my Yeasu or Alinco UHF/VHF rigs. Otherwise the plugs are the same. In a pinch I know the Yeasu/Alinco chord will work but I wouldn't use it for a permanent replacement. ...and then at reduced power on HF. No doubt that the 706 on HF draws more from the chord than the vhf rigs so the larger size should be from larger guage conductors.

I could be wrong but the math works. =)

God bless

Thanks to all,

Yes they are the same. I was at work when I sent the email as I was ordering a cable and wanted to make sure I had the right one. I found a nice one that claimed to work on all three rigs which is why I asked. Thanks again. My next step is to change out the DTC114EU on the filter board as it has the lo rx on hf. I picked this one up from an estate for a great price, it had a ssb narrow filter in it as well.

# 17830. Power range settings for 706

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-28 01:15:02 UTC
From: vk4vil
Topic: 17830  Message: 17830

I have a 706 standard and the power settings are 1w-9w then straight to full power, designated as "H".
I'm currently completing studies for advanced level (Australia) and will want to add an amp (to 400w).
Consequently, the 706, with current power settings will be a problem, attached to the amp.
Can I modify power settings to obtain the full range?

Thanks.

The IC706 "originsl" is a bit tricky with an amp. It is 100W on HF and 6m and 10W on 2m. Lowest power is a fee Watts but they used the ALC to adjust the power portionately with the output power scale. 5 is 50W etc. Even when turned right down there is a 100W spike for a fraction of a second that can upset and even destroy some amps. Either get one that needs 100W drive or is "bullet proof" or has a decent delay in the PTT switching.

Have you actually measured the power ?  It should go from a few watts to the maximum in very small steps.  Even as you turn the dial between the numbers , the power will change slightly.

As mentioned, the 706 produces a full power spike for a fraction of a second every time it is switched to the transmitt mode.

Here is a chart of the power I am getting out of a 706.  I would think every rig would be slightly differant and even the wattmeter can be off slightly.
  Icom 706MKllG Power Output

Setting 3.8 28.5 50.2 144.2 432 440 449 MHZ

L 2 2 2 2 too low too low Not Checked
1 3 5 3 3 too low too low Not Checked
2 7 8 7 6 0.8 1 Not Checked
3 14 17 12 9 2 2 Not Checked
4 24 18 20 11 3.5 4 Not Checked
5 38 25 32 18 5.8 5 Not Checked
6 50 40 45 25 8 7 Not Checked
7 65 55 65 33 10 9 Not Checked
8 85 75 80 42 15 12 Not Checked
9 100 90 90 50 20 16 Not Checked
H 110 100 100 55 22 18 17
 Voltage 13.8 from Astron RS-50

The chart is hard to follow, but the first colum is the dial setting , the second is the power at 3.8 MHZ and the second is at 28.5 mhz and so on .  Notice the power out is not linear.

The numbers aren't watts -- just a relative scale as others have pointed out. Just choose your amp carefully so it handles the full output from the rig. If you HAVE to get an amp with low drive, put an attenuator inline with the TX path.

The numbers on the front of the radio are relative to the VOLTAGE at the transmitter output because the voltage is sensed in the power control circuit. Therefore they follow a square relationship since P = E squared over R.
Place a decimal point in front of the display numbers for the relative voltage where "H" = 1.0

Therefore, for HF, a very close approximatoin is:
7 = 0.7 >>> squaring >>> 0.5 power or half full power or 50 W
5 = 0.5 >>> squaring >>> 0.25 full or 25 Watts

etc.

The numbers previously posted follow this scheme.

Because there are setps (power changes) IN BETWEEN the display number changes, the power changes as the dial is turned between numbers without any change in the display numbers.

My data was taken turning the dial UPWARD and stopping just as a number changes. Therefore, my data is at the bottom of each "number band".

# 17840. IC-706 MkII does not hold Freq and Band buttons beep but do not work

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-29 13:55:16 UTC
From: n4pjx
Topic: 17840  Message: 17840

Hello all I have been digging around the site but have not come up with any info on this. Maybe I have not looked hard enough, anyway I have a MkII and everytime I power up the radio it seems like it does a reset and dumps all the memory and the menu settings. I have checked the band buttons to the best of my ability and I can not see or feel where they maybe stuck. They still beep but there is no change when pressed. The radio works it will take memories but as soon as you turn if off and back on eveything is wiped out.

Thanks for your time,

Jackie,

Check the power cord connector at the radio. Those contacts expand thereby making poor contact with the "pins" in the radio connector. They will support low current draw (receive) but as soon as you draw high current through them (transmit) the rig loses power and shuts off.

Try carefully compressing the contacts in the connector on the cable and see if that doesn't solve the problem.

the same thing happen with one of my friend's 706. a lot of power cords these days are made so cheaply and with too small of power cable and also the heat that made by these cheap power cables makes the pins melt. like the past person said about pins. the best thing to do if you know how is to rebuild a power cable with 10 gauge wire in my own opion. yes 10 gauge might be over kill but at least you wont have much of heat and it is a lot better then the 14 gauge companies are making. my 400watt power inverter came with a 14 gauge wire to power it lol.

Try cleaning the DC Voltage connector at the back of radio. Also remove radio front head, and clean the golden pins both-- of radio body and head side..... hope this will help.

Yes, I do a lot of CW txing with full 100 watts. To me also looks as if the DC wire gauge, which I am using now, is THIN with respect to 20A current. I have TS50 and I use it same way on CW, but TS50,s cord does not get that much hot as of 706. I think you are right, I need to use thick wire when it comes to long Full power use on CW.

The 706 power cord is 12 AWG, not 14 unless something has changed recently. I've been using those cords for decades with no issues. If the fuse holders are getting warm, it might be worth replacing them, but the cord should be fine unless it's been exposed to a lot of moisture degrading the copper inside.

Does anyone have or know a link to a service manual for mark 2g with the newer mittsubishi finals. I'm going to replace the VHF/UHF final which is cooked. There is a part next to it that may be cooked also I'm trying to identify. It may be a diode.
Looking down on the the final with front of radio facing you it is on left side of final.

Thanks, Mike R

Let's look at this from an engineering stand point:
You say the chord is getting hot but then say " specially the 2 fuses " (sic.). If it is the fuses that are getting hot, then one may want to check the connection of the fuses in the fuse holders. If they are dirty or corroded, this could be leading to high resistance which will result in localized heating.

If the entire cable is getting hot, then it is apparently under sized. If it is getting hot, then you are losing power to heat because of high wire resistance. Unlike the theoretical wire of zero Ohms we assume in circuit analysis, wire has resistance.

It is easy to test the whole assembly to see how bad things are. Use a volt meter to measure the voltage at the supply while transmitting at full power, then use the same meter to measure the voltage at the radio end of the cable at the power connector while transmitting. You will then be able to calculate how much power is going to heat. If it unacceptable, build a new power cable or shorten the present cable to an acceptable loss.

Yes, even the OEM cable has voltage loss. As you noted, the rig is drawing 20 Amps. I have measured up to 1.7V drop with the OEM cable. If you don't need the full length, shorten it. If it is a long run, use larger cable.

Also, check your antenna connections, especially if you are mobil. This problem is almost always a connection problem of some kind ...including grounds.

God bless

# 17864. 706 DC cord hotting up

Yahoo group: ic706 (2010 — 2015)
Date: 2010-03-31 15:56:00 UTC
From: Mike Rodgers
Topic: 17853  Message: 17864

I know a guy in england that melted the connector on the back of the radio.
Watch that duty cycle. Your probally heating up the finals and the board too.

Make sure your power supply is adequate and shorten the wires if possible. Inspect all connections.

I made a qso this morning on ten watts so not sure full power is necessary but I know it's hard to reduce power, we want more.

I'm looking at replacing a VHF final and I can see the hf finals have been hot enough to ooze flux on the solder joints.If they're not Mitsubishi finals you probbaly can't get any replacements so take care of them and happy QSO'ing

Mike R

This should be obvious but you have tried the squelch. Do you get rf signals on meter? Mike R

If transmit is ok that rules out antenna or antenna jack on 706.

If you can't get anything on the s meter then it's somewhere besides the audio circuits providing rf gain is right.
What about am broadcast stations, I'm guessing there should be nothing there either.

Is green receive light on?
I guess you have noise on 2m ssb?

I'm afraid this is beyond me. Mike R

There is a switching transistor that goes bad causing no HF RX when it bites the dust. Its located next to a relay on the filter board (I believe RLY1 is operated by Q1 Icom part number 1590000680 S.TRANSISTOR Common part number DTC114EUA T106) If it goes bad, the relay is held to the favor the PA in RX cauing the radio to go deaf on all bands. I hope this helps you.. Richy N2ZD

Dear Mike,

Well, 10 watts with a dipole on 20 meters is not enough to work DX, but with a beam, yes, it is ok. So with dipole, about 80-100 watts on 20 and 40m is just right power when condx are marginal. So, I use full 100 watts with 0db gain Dipole and that works good on 20 and 40. But at that level on CW, power
cord does gets hot.

You say that even if power CORD is not getting that hot but PA transistors are under extensive heat and can get destroyed after prolonged use on CW !!!!! that is very scary .....

I use TS50 with full 100 watts and found that it,s CORD does not get that HOT.

So even if I use thick gauge CORD with IC706 , which does not get hot, but PA Transistors are at stake.

From: Mike Rodgers
Topic: 17872  Message: 17873

Rakesh, if the cord is getting way hot, it's telling you something and it may be resistance generating the heat.

Make sure all the connections are good. Consider using gold plated terminals. It might be worthwhile to make a heavier gauge supply line but I would try to shorten it first( more length equals more resistence. You might even need to move the power supply closer. If you make a new cord use the larger size fuses ( not more amps but bigger physical size). Wal Mart and stereo shops have these.

Watch your transmit duty cycle. Most recommend a 50% duty cycle.

By the way, I run a 80m delta loop.it's not that good on 80 and 40 but is on the higher bands. Only problem is you can't turn it.

Happy QSO'ing. Mike R

I tried a short Cord, about 12inch, it still becomes very hot......but the DC connector at the back of radio, does not get that hot as the wire, specially near the fuse holders. I will check if the fuses are tightly fit in holders.

Rakesh

The fuse holders are probally giving some resistance.I don't particularly like those type fuse holders that slide in.

If you can find the oversize ones I mentioned, change them out. They are a little pricey and some of the oversize fuses are gold plated. Mike R

# 17878. Re: power drop to 2 watts

Yahoo group: ic706 (2010 — 2015)
Date: 2010-04-02 13:06:37 UTC
From: pedro lecuna
Topic: 17878  Message: 17878

To begin with I apologize for the English since it is the result of
the Google translator.
Greetings to everyone.
My ic706 mk2 has the following problem.
When I start to transmit at level 4 or 5 power the meter mark between
20 and 40 watts, but after about 15 minutes of work (PSK31) the power
drops to 2 watts and then I have to lower the level to 3 for
potencencia to dial between 10 and 15 watts.
The problem is on all HF bands and all modes.
Thank you in advance:
Yv4ow
Margarita Island

From: zl1tbg
Topic: 17878  Message: 17880

I have a 706 MK2G which has 2 problems similar:

on any HF band, the power output reading and VSWR reading would change. There is a small plastic trim capacitor in the VSWR detector bridge which "melts" and can be replaced with approx. 3.3pf ceramic capacitor for a rough fix.

on any HF band, after transmitting continuously (any mode) for approx. 5 minutes, output suddenly drops to approx. 2 watts. Other stations can still hear me at this reduced level. I can restore the output to normal only by changing to a VHF frequency, then briefly transmitting on that frequency, then change back to the original HF band and full power is obtained. Just powering off the radio will not restore.

I have traced the loss of power to be caused by a loss of drive to the PA board. The HF drivers and finals and filter board and relays are not the problem. So I suspect its a ALC / refl. power shutdown issue detected perhaps erroneously by the control board and its shutting the drive down. It may or may not be related to the earlier problem with the fwd/refl power sensing circuit. This is the first version of MK2G with the early finals no longer obtainable (but mine are OK) I am not fixing this fault further, just describing the symptoms and workaround if that helps for your situation. I also have a original 706 which is a better radio (but no DSP or UHF)

Topic: 17881  Message: 17881

Dear 706 fans, anyone ever run into this?

Distorted and low audio on FM and barely any audio on AM..? In SSB the rig works fine.

The supply is ok, mic is ok, swr is ok, checked into a dummy load. Face on radio. All of the usual gremlins have been attacked, this problem is in the rig, just checking to see if anyone has run into this problem. I've never owned a 706 before.. Tnx Richy

# 17882. HM-118TN Mike compatibilty

I purchased a used IC-706 (first model) about a year ago, the HM-103 mike came with a broken mod. plug and I have it taped in place.

At a local hamfest I acquired a HM-118TN DTMF mike with no information on it usage or compatiblity. Anyone have a schematic of the mike? Is this a suitable replacement? Will it work on my original model 706 as is, or are wiring modifications needed? Tnx

I have a HM-118TN mic that I bought new with my 1st 706m2g. Works just fine. I have used it on a 706 original with no problems.

I had a similar problem with my 706MKIIG. The radio worked fine on SSB but would not transmit on FM. It did receive on FM. I sent it to the ICOM Service Center in Michigan. They "realigned" part of the radio. (I can't find the repair invoice to see what they actually did.) They are fast and reasonable. I had the radio back in about two weeks and the charge was about $55.00 including shipping back to me. ICOM Service Center Michigan-SAR Technical Services. (269)429-2334. Talk to Matt when you call. Usually you will have to leave a message, and he will call you back. Hope this helps. 73, Jim W0VKW

# 17885. 706MKIIG power cycles on-off-on-off

Yahoo group: ic706 (2010 — 2015)
Date: 2010-04-06 23:10:58 UTC
From: k1uwj
Topic: 17885  Message: 17885

I'm new to this group, I'm just getting back into radio after many years absence. The last rig I had was vacuum tubes before they were called boat anchors. I purchased a used 706MKIIG that has developed a power problem. I am using it as a base (not mobile). One day I came into the shack and the radio was "off' but what sounded like a relay was clicking-clicking-clicking. the rig would not power up. I disconnected power cord, left it alone for a few days, now the rig powered up but would randomly power itself down, then up, down, up down, sometimes it stayed on for a couple of minutes, sometimes only a few seconds.
Sent it off to ICOM for repair. They found no problem and blamed my power supply. got rig back and worked fine for 6 months. Now the problem is back. Power up-down-up-down. The power supply is a 25 amp Lambda, but it has the same problem on battery power.
BTW, I have not even tried to xmit yet, all this stuff is during RCV mode.
I have checked and rechecked the power connections, tightened the crimps, took off the cover and checked the internal crimps....no joy.

Any ideas as to what to do next?
Thanks
K1uwj

Tom, many times such issues are traced to a poor connection in the power cable. Some after market plugs simply do make a good connection to the ICOM version of the plug.

The symptoms you describe sound like the voltage at the 706MKiiG, inside the radio, is dropping below 11.5 volts.

The 706s are a very popular radio. Check around the East Templeton area, local ham clubs, etc to see if you can borrow a cable for a check test.

DD, W1MCE ... near Concord, NH or I'd make my cable available to you :-)

Thanks Dave. I have thoroughly checked out the power cable, even to the point of applying power directly inside the xcvr, bypassing the molex plug. I also cleaned the gold connectors on the "head"...no change.
The last thing I tried was to increase the power supply voltage to 14 volts from 13v.....currently the unit seems to be working ok... we'll see. But like I mentioned in the original post, the problem is not reproducable, it comes and goes.

AHA!

The 706MKiiG is designed for 13.8 VDC at the radio.

If the voltage drops into the 12 volt range funny things happen. I think you put your finger on the issue. Keep the voltage at 13.8 at the radio under 20 ampere load.

Let us know if/when this works out.

DD,

Thanks Jim,

I corrected the FM issue by tacking down the pot for FM PLL and then gave it a few turns back and forth and set the voltage to 1.8v as per the manual, then I reset the deviation and now it works like gangbusters. It appears to be a common issue with both HF and VHF/UHF PLL and reference circuits drifting on these rigs. I found every single adjustment for PLL voltages out of whack by some degree although the rig worked fine on HF. Thanks, Richy N2ZD

Well I thought I had nailed it. Power supply maxed out at 14 volts (at the radio). Problem seemed to go away, but it just power cycled itself while I's sitting here. But only one time..... Maybe I need to send it to the guy in (florida?) problem is he could run it for months without seeing the problem.....arghhh!

There is built in power shut down cycle in MKiiG. Do you have it turned ON or OFF?

OK -- DC Sply good and voltage ok.
Now try another DC cord preferably with fuses eliminated.
Jus remember if fuse looks good it means nothing .. cuz it can ohmeter good
but be bad/open under current load

Hello
I just bought an(other) 706mkIIG because it was quite cheap annd came with an AH-4.
However I discovered that the front plate latch and spring was missing.
It is MP7 and MP15 on the drawing in the service manual.

Does anybody have a spare or perhaps know of a good place to buy it?

I've ordered these from icom for less then $10USD. Once, when repairing a friends radio, they did not even charge for the parts.last time I ordered them, I also ordered a spare set since this is a common problem.

If you order from overseas, I would ask them to ship the parts in a standard envelope to save shipping time as they have been putting these small small parts in a much larger box then needed.

From: k1uwj
Topic: 17885  Message: 17897

I want to thank everyone for the inputs. for now the problem seems to have gone away...duh!
Mike, I can't fine reference to an autosleep time in the manual, but the term autoSLEEP implies to me that the rig goes into some sort of standby mode. My problem is total power off/on.
I will be back if the problem recurs, thanks again

Tom, I forget the correct term but you can set for auto turn off of 30 to 120 minutes of inactivity. It will beep 3 or 4 times and then power off. If I were at home I would find the page #. Mike R

If you have the manual ... page 51, ^ AUTO OFF (auto power off)

It is set in the Initial Set Mode.

# 17900. distorted audio and loss of transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2010-04-11 22:16:02 UTC
From: KG6CZX
Topic: 17900  Message: 17900

I have a 706MIIG works fine sometimes and then goes nuts. On two meters the receive audio sounds like the mike is being held out the window going 90 miles an hour and I also lose transmit. On HF receive just goes away and no transmit. The problem only happened once in awhile but is getting much worse. Anybody have any ideas? Thanks John

# 17901. Re: distorted audio and loss of transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2010-04-13 02:03:18 UTC
From: ft857guy
Topic: 17900  Message: 17901

I recently picked one up (non working) and found the following problem. Distorted 2m/70cm audio. I started by realigning all of the vco/pll circuits. Although my HF was fine, I found every single voltage was off on HF and vhf/uhf. If you are up to the task, begin by adjusting all of the PLL and VCO circuit voltages back to where they belong. I also found that my PLL reference pot needed to be reflowed with an iron. All is good now and I am very impressed with the radio as I have never owned a 706 before and I like it very much. All it takes is a good digital volt meter to do and is quite easy. While you are in there, retighten all of the boards, bend all of the tangs up and make sure everything is seated properly. Regards, Richy N2ZD

Thanks Richy for the help I will get a copy of the service manual and start poking around. Also noticed now even when the radio is working the DSP unit is not working at all. I guess just another clue. The rig worked fine all the way to work today but would not work at all yesterday...I wish it would just fail once and for all. Much easer to find the problem that way....Again thanks for your input

Be careful what you wish for. This sounds like the same issue my 706 orig had. On FM it started as an occasional rushing noise on received signals. I would have said it was a dirty volume control if they still had a pot in the audio chain. Then the noise became more frequent on FM and louder. Then SSB became unstable and noisy. I was in and out of the 706 looking for the loose connection so much, I could get to the PLL board in two minutes from un-plugging the power.

I kept depressing here, tapping there, cooling this, wiggling that - then - nothing. That was three years ago. I tried for hours to try to get it back on the air. I measured voltages that were way out so figured it must be a PLL problem. I posted here and got zero response. The parts still lay there, waiting for me to sit and try to bring it back to life. About 2 years ago I read on another site that the PLL Board +5V regulator has a tendency to break loose and need reflowing, but I have not had the chance to look at that. Other things in life have taken priority.

So check the Regulator "Transistor" and let us know what happens. I may just blow the dust off the rig and try again if there is hope.

Good Luck,
NJ2L

# 17907. Re: [ic706] Re: distorted audio and loss of transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2010-04-14 15:08:33 UTC
From: Larry J. Ford
Topic: 17900  Message: 17907

You didn't mention it.

The fellow to whom you were replying had a reference in the body of his message (which you quoted as a prior message) to the "DSP" not working.

That would imply the unit in question is an IC-706MKII or later.

Larry J. Ford

It did not. I don't believe I mentioned DSP. But a PLL is common to 706 design.

If relaying my experience to try to help John was wrong, I apologize.

(To Larry.D.Lefczik@...) huh? since when did the 706 early version had DSP?

Be careful what you wish for. This sounds like the same issue my 706 orig had. On FM it started as an occasional rushing noise on received signals. I would have said it was a dirty volume control if they still had a pot in the audio chain. Then the noise became more frequent on FM and louder. Then SSB became unstable and noisy. I was in and out of the 706 looking for the loose connection so much, I could get to the PLL board in two minutes from un-plugging the power.

I kept depressing here, tapping there, cooling this, wiggling that - then - nothing. That was three years ago. I tried for hours to try to get it back on the air. I measured voltages that were way out so figured it must be a PLL problem. I posted here and got zero response. The parts still lay there, waiting for me to sit and try to bring it back to

life. About 2 years ago I read on another site that the PLL Board +5V regulator has a tendency to break loose and need reflowing, but I have not had the chance to look at that. Other things in life have taken priority.

So check the Regulator "Transistor" and let us know what happens. I may just blow the dust off the rig and try again if there is hope.

Good Luck,
NJ2L

Thanks Richy for the help I will get a copy of the service manual and start poking around. Also noticed now even when the radio is working the DSP unit is not working at all. I guess just another clue. The rig worked fine all the way to work today but would not work at all yesterday... I wish it would just fail once and for all. Much easer to find the problem that way....Again thanks for your input

From: Joe Isabella
Topic: 17909  Message: 17910

There are a couple chip caps that make up the 2m band pass filter that can get knocked off the board by the power connector. Check those first. But when you open the radio, do it carefully -- the part may be loose in there and fall out. That's what happened to mine. When I re-soldered it, I moved it back away from the connector as much as I could. Hasn't been a problem since...

Joe, N3JI

Looking back at messages in this group over the years, I see a few questions about the availability of MRF-255 transistors, so I assume that these are the ones used in the 706 series -- at least until two or three years ago, when the MKIIG was redesigned to use Mitsubishi finals.

on this web site you can find the transistor
http://www.plccenter.com/buy/MOTOROLA/MRF255?source=AdWords_PN&gclid=CP3EnqTkkaECFZVY2godVUmsNg
they have it for $96.

Correct me if I am wrong, but I believe Bill stated his price for the pair.  That means 2, but the lower prices on the internet all seem to price them per unit (1).  That being said, his price is in the ball park.

I was in Ham Radio Outlet in Woodbridge yesterday, and according to the
salesman (who I know personally) the 706 & 703 are discontinued, and
limited to the stock that's currently in the pipeline....

The IC-706MKIIG is a current offering by ICOM, but it uses different finals than the IC-706MKII (does it not?), which is no longer produced.

FWIW Icom America still offers for sale the IC706MkII. I'm sure they are selling new units and not 2-3 year old stock. Let's not get that rumor started again.

Up until two or three years ago the MkIIG still used the MRF-255 finals; mine -- bought in 2002 -- does. AIUI, when Motorola decided to discontinue the production of the MRF-255, Icom redesigned the rig to use Mitsubishi finals; these are not interchangeable, so the whole PA board is different.

I have 11.5 volts dc on my speaker line. I have disconnected the pll board from the main board and there is no longer dc on the speaker line but there is still dc on the ear phone jack in the front of the radio. I believe this rules out the pll board as the problem. as soon as this happened the green transmit light lit and now it is in transmit mode. any ideas on were the dc could come from would be appreciated. So? I am wondering what else will fit in the slot, and still work with acceptable degradation? I have seen MRF transistors in junked cellsite pasms but did not look at the numbers on them. Some times the metals salvage guys get them. They call me when radio/electronic junk shows up.

# 17927. 100w HF Mobile in an LPG fuelled car

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-03 14:13:08 UTC
From: kav246
Topic: 17927  Message: 17927

Hello Group

This is not exactly off topic as it relates to IC-706 (mk11) use but it is related more to the vehicle than the radio. It may also be more specific to the UK due to the vehicle and fuel in question but here goes....

Is any one using an IC-706 100w HF + Smartuner setup in an LPG fueled Range Rover? If so, did you encounter any specific problems with the LPG side,eg RFI (in either direction!) that were different to an average mobile installation?

If you have the RangeRover / 706 / Smartuner setup but running ordinary unleaded petrol did you find any insurmountable problems with the RR's copious electrical systems?

Is anyone running 100w HF, Smartuned or otherwise, in any vehicle with an LPG conversion?

I just have an uneasy feeling about RF and LPG in such close proximity. I don't know why because the tanks are certainly stronger and I'm unlikely to transmit whilst refuelling so it SHOULD be at least as safe as petrol but I just don't know.

I ran this past the Smartuner group first as its the tuner thats making me feel uneasy but have had no response so far.

With the number of 706's in use there's gotta be somebody with something at least vaguely resembling the set up in question.

I await comments with antici......pation!

Regards
Kav

I don't think, the fuel will be the problem but the delivery system to the engine/injectors,, their monitors/sensors and computer interface. Seems like Range Rover would be the best source, they must have experience, they use this truck all over the world.

# 17929. UNSTABLE AM TRANSMITTED AUDIO ON 706IIG - PLEASE HELP ?

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-05 20:51:39 UTC
From: simon.worsley
Topic: 17929  Message: 17929

Gents

I am using my 706IIG on 2metres with very low output power (around 2watts if I beleive my power meter - on the lowest power setting on the rig). I am using it to drive a transverter.

When first testing my transmitted AM audio by simply listening on a known good receiver - it sounded off frequency and very nasaly and completely un-workable.

After talking to some locals and some basic research, I concluded it is a matter of adjusting R1080, R1042 and R999 to get it right. It certainly is a matter of adjusting these three settings. The biggest difference is R1080 there is a tiny hairline position of this pot that makes it sound on frequency and loud - R1042 seems to be like a fine tuner of R1080 and R999 simply is AM audio level gain control.

I have spent hours and hours fiddling with these three settings, and can get the transmitted AM audio to sound perfect.

However, here comes the problem.

When I leave the radio for 5mins - it needs re-tuning again. Then its perfect again, and then 5m later needs retuning. And so on. It seems to lose its memory from my tuning of the transmitted AM modulation section in the rig.

I read on mods.dk that unstable AM transmitted audio is a known about bug on the 706IIgs - but I do not know of a fix.

The same thing happens on a variety of Microphones.

Any ideas ?

Kind Regards - Simon G7IVJ

I can not help with the audio, but the 706 usually puts out a short spike near full power when first keyed up.  The will hapen on every transmission.  Not too good for most transverters.

From: mike k
Topic: 17932  Message: 17932

I've had a 706 for a while and it works fine in the house.
I'm starting to learn a little about APRS and have been looking for some information specific to attaching an APRS encoder / Decoder like the Opentracker + to the 706MKII.
Where can I find information about connecting an Opentracker + or a tinytrak3 to a 706?
Maybe I'm just not using the right terms in Google or in this group forum, but I typically get web sites or forum messages that mention both APRS and 706mmkII separately but not in reference to one another.
Any tips about where to look would be helpful. I've found several great tutorials about APRS too, but none that mention the 706MkII.
Thank you for your ideas

# 17936. Re: [ic706] APRS and the 706MKII anyone?

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-08 19:34:28 UTC
From: Jeff Moore
Topic: 17932  Message: 17936

Using a 706 as a APRS tracker is a gross waste of radio and that's probably why you're having difficulty finding anyone doing it.

Get a 2m HT or a used 2m mobile and set that up as an APRS tracker. Using an all mode-all band radio this way is dumb - the ONLY reason to do it is if it's all you have and even then . . . . . .

I have a 706 MKII and I have connected a tnc to it and fired up UIView on my computer hooked to it more as an exercise than anything else. I was more interested in using it for straight packet ops on 2m and HF than anything else, but the exercise in doing it is a great test of the connections and seeing how soundcard packet mode works (I used both the tnc and the soundcard interface). I would NEVER install this setup in my car and use it as an APRS tracker.

Get out your manuals and make some cables if you really want to do this.

Use 8 gauge wire to run to the location you need, then connect that to the 10 gauge wire for the 706. For the long run you are proposing, 10 gauge would not be a good idea.

I'm not capable of doing the calculations or doing the analysis myself (well, probably could if I could devote the time to it), but should you be concerned about a voltage drop in a power cable run of 20 feet?

A friend of mine with a Ten-Tec rig was experiencing random and curious problems with audio dropping out, signal fades, and the like on transmit. Having the rig thoroughly bench-checked by Ten-Tec with no issues found, the solution posed by Ten-Tec tech support was to "shorten" the power cable. Apparently, his was long enough to be causing voltage drops and was playing havoc with the rig's microprocessor, etc., on transmit.

Don't know if the 706 is similarly sensitive, but it might be an issue if using a power cable significantly longer than what ICOM specs for use with the rig.

A bigger gauge wire should help, but, again, "running the numbers" might avoid a problem.

I did not do the calculations but used a graph I have so the numbers will be slightly off. The numbers are for 10 amps so if the rig draws 20 amps you can double the voltage drop.
Number 8 wire has a drop of 7 milivlots per foot.
Number 10 drops 11 mv/ft
Number 12 drops 15 mv/ft

So for 20 feet long wires (that is 40 feet total wire, one for the positive and one for the negative)  you drop .28, .44 or .60 volt at 10 amps and double that at 20 amps.

There will be some other drops for the fuses and connectors to add to this.

There is a wire reference table at http://www.powerstream.com/Wire_Size.htm
Probably a good idea to pay attention to maximum amp/power capacity of
wiring, as well as voltage drop. Make sure to fuse properly. Over designed
may be better than under designed.

A second to the suggestion about Tower Electronics. But if you or friends are coming to Dayton next weekend, you will find whatever you need there because it will be there somewhere. Finding it will be the challenge tho.

Topic: 17933  Message: 17946

Beware Tower Electronics for HF DC power connectors. I bought one from them at the Shelby Hamfest and it did not have the right female pins. I'll explain.
The connectors used by Icom/Yaesu/Kenwood for the six pin HF power connector (even though they only use four of the six) are made by JTC, Japanese Terminal Company, not Molex, AMP, etc. The inside diameter of the female metal connector pins, and outside diameter of the male pins on the radio, is ~.082". Molex pins are .092. If you took the female alone, no housing, and place it over the male in the radio it has a lot of wobble as it does not make contact on the entire length of the pin, but only on the lower flared shoulder. This of course greatly lowers the contact surface area and the current handling .

When I mentioned this to the guy from Tower he blew me off as "not knowing what I was talking about." I have a EE degree and worked for years in PLC and TV design where I spec'ed connectors. I found that Cedar City sales and Buxcomm had the right ones. But, JTC parts are hard to come by in the US and Molex is cheaper here.

I bring this up because I know in the past others have used Molex and experienced "power issues." Some reported taking a Dremel cut off tool and cutting a relief slot the length of the female and squeezing the female to the smaller diameter fixing there problems.

Another note, make sure you split the positive and negative wires between two pins like the factory cable, The JTC pins are rated at ~11 amps, so paralleling each gets the ~20 amp rating for the HF rig.

You can approximate voltage drop vs. length by going to the ARRL Handbook, or another online source, and using the wire chart to see the resistance per foot of the wire and use ohms law to calculate voltage drop at operating current. Remember, 20A fuse will not blow if the wire is overheating a 16A, melting its insulation and causing a fire.

Radio Shack has the same problem. Same stock number may have different dia pins. Found this out when I made up a bunch of external fans.

# 17948. Re: APRS and the 706MKII anyone?

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-09 21:26:14 UTC
From: nb7o
Topic: 17932  Message: 17948

I have a friend who lives and travels in a Motorhome. He has an ICOM 706IIG installed in it. Due to a variety of reasons he cannot use the HF while mobile. Therefore he uses the VHF side to xmit his APRS beacon. Since it is the G model he is able to use the 6 pin data port. He uses a Tiny Tracker 3plus. Since the 706 and 706II do not have the data port you will have to use the mic jack if you want to use the radio.

The tiny tracker 3plus is an encode only device and the manufacturer/seller, Byon, is great to work with. If you want to encode and decode I would suggest looking at the tiny tracker IV or I prefer the OT2m made by ArgentData. Scott is as good to work with as Byon. I strongly recommend both companies for APRS equipment.

If you look up my stations with the link below you can see both pieces of hardware put to use. NB7O is a TT3+. NB7O-11 is an OT2m. NB7O-12 is a digi that uses the T2-135 board from Argentdata and is installed in an Alinco DR-135. NB70-13 is a laptop that runs UIView and is used for ARES portable work.

You can track us at:

the same company that makes the TT3 Byonics makes the Microtrack series as well I have the MT-8000FA and love it, The RTG I have heard great things on it and the combo is $190. complete

then you do not need to tie up your HF or other voice radio!

as for not using HF while mobile well that is a personal choice as it can be and is done every day I have a 706MIIG in my suburban with a screwdriver antenna and a yaesu ft-2820 with DStar it works great.

Since it is the G model he is able to use the 6 pin data port. He uses a Tiny Tracker 3plus. Since the 706 and 706II do not have the data port you will have to use the mic jack if you want to use the radio.

Hello

I thought all the I/O's of the mk11 G's data port (and indeed 7 more)were available on the mk1/11's 13 pin Accs port.

I've certainly injected data modes through it and used it to give the "tune button" function with an SGC tuner.

I confess though I have not tried to utilize it for APRS so I could be wrong.

Mon May 10, 2010 2:37 pm (PDT)

YOU can use the mic jack, I use the dataport on the back of my 706 MKII

Jeff -- KE7ACY

----- Original Message ----- From: kav246

Since it is the G model he is able to use the 6 pin data port. He
uses a Tiny Tracker 3plus. Since the 706 and 706II do not have the
data port you will have to use the mic jack if you want to use the
radio.

Hello

I thought all the I/O's of the mk11 G's data port (and indeed 7
more)were available on the mk1/11's 13 pin Accs port.

I've certainly injected data modes through it and used it to give
the "tune button" function with an SGC tuner.

I confess though I have not tried to utilize it for APRS so I could
be wrong.

Kav

you MIGHT find one on the ICOM site BUT please not that ALL of the 706 series radios are now OUT OF PRODUCTION there are a few of the MIIG's that are new on the shelves yet but for the most part you will be finding used radios now.

Out of production means stock is limited to what's on hand or in transit.
The 706 doesn't have the digital dsp and digital filters BUT it is a proven workhorse and I don't know but I assume it has probally set records for sales.I have a mk 2 and mk2g.

Yes, the 706MKIIg & 703+ are both discontinued... The 706 was long since replaced by the 7000. There's a 20W version of the 7000 available in Japan, I don't know if that'll make it over here to replace the 703+....

HRO-Atlanta confirmed this report on Friday.

I think the rep also said that at least HRO-ATL is out of existing stock for the 706MKIIG.

Don't know if other HRO stores are out of stock as well.

Yes, the 706MKIIg & 703+ are both discontinued... The 706 was long since
replaced by the 7000. There's a 20W version of the 7000 available in
Japan, I don't know if that'll make it over here to replace the 703+....

That seems to be a problem with lots of ICOM radios. They seem to buy enough to sell the radios, and not too long afterwards, critical replacement parts are no longer available. The only hope for repair is another radio that's being scrapped or sold as parts to be a "donor" unit to fix another.

I've had a mk11 (pre G)since it was current. It's been in 4 cars, done a lot more work than my base gear and it really owes me nothing.

I've been considering upgrading (would it be?) to the G for years but have been unable to justify it as there is nothing physically wrong with what I have appart from the lack of UHF. However if Gs are gonna be obsoleted it looks like it's now or never time.

My question to you is would you still recommend the mk11G or would you, at this late stage, skip straight to a 7000?

None of these mobiles are cheap over here and the benefit of your hindsight might make the difference between me spending 700 quid or £1k.

On the otherhand I could just keep what I have and spend nixi. Afterall there are definite benefits to running seperates so long as I still have room for all the head units!

Your opinion would be appreciated.

Well, I've run the MKiiG for more than 8 years mobile in a climate that will see -15F during the winter and 95F+ during the summer. I use HF and VHF. Like you, mine owes me nothing.

I thought about 'upgrading' to the 7000 late last year [2009] and decided not to. "If it ain't broke don't fix it". The 7000 would add nothing to my mobile experience.

I'll run my 706MKiiG until it totally dies beyond repair or resurrection.

Don't blame ICOM! The semiconductor manufacturers drop product lines so they can remain profitable.

I spent 4 years of an electrical engineering career in design and production of semiconductors. It is a savagely competitive business.

The manufacturers must: "Grow with the technology or die!"

The governments have the same problems on material they purchase . Think about this. The USAF still flies the Boeing B-52 that was introduced in 1952, almost 60 years ago. Airframe fatigue, engine upgrades, weapons systems , etc. have all worn or aged out. Who in the government, 60 years ago, would have bought 1000 engines, 400 wing sets, 800 wings mount boxes, of a 1960 design for a 50 years storage inventory. Answer: upgrade or replace is more economical. Same with semiconductor technology. Same impact to the users of those semiconductors.

Don't blame ICOM. They are simply responding to market forces.

I have both (7000 and 706mkIIg) and have to say it's my opinion that 7000 is heads and shoulders above the 706. Maybe it's just me but I swear the recieve on the 7000 is light years ahead of the 706. If you buy a 7k you won't regret it.

I used to have a car like that too ... In fact it was a product of Great Britton ... AH! the nostalgia as I recall my Triumph TR-4 from my reckless bachelor days ... sigh.

But, the TR-4 did have 80 - 10 meter HF permanently installed. The old Gonset Twins were mounted on the "jump seat", if you can call it that, behind the driver's seat. Yep! I had to drive forward but look backward, into the back seat, to run the radio :-)

Remember that the 7000 is a full IF (dual) DSP rig, the 706 series is all analog with an AF DSP added on as an extra. The DSP capabilities at the IF make it better than a MKIIG full of filters, and also comes with the high-stability timebase as a standard option. And don't discount how much easier the color display makes it to read in a mobile environment. It's hard to quantify, but I think a few split seconds here & there while driving can really make a difference. The extended controls on the mic is a nice touch as well.

Don't know if that helps you further or not, but it is definitely NOT just a 706 with a color display. It's a completely different radio, and worth the extra cabbage IMHO....

The IC-7000 is certainly more sophisticated than the IC-706xxx.

But the 7000 seems to have some continuing problems from what I read on the 'Net and other places.
The 706 is not trouble-free, by any means, but my sense is that the 7000 does not seem quite a "hardy" on average as the 706 has proven to be. Of course, time will tell if the 7000 has as long a run as the 706.

I own and use the 706MKiiG as a mobile, the original non-Pro 746 in the home QTH for 30 & 60 meters and the 756P3 for the workhorse base station. The 756P3 has tremendous DSP and easily outperforms the 706 and 706 receivers in crowded or noisy band conditions.

The DSP in the 7000 is a highly valued increase in receiver performance under crowded or congested band conditions, QRM/QRN. If your planned usage includes HF contesting, DX-ing, etc. Then the 7000 upgrade is warranted. IF your plans are casual rag chewing and normal mobile activity, then I would not justify the change from the 706.

Just my opinion.

# 17985. Re: AH-4 Control Cable Source

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-19 16:20:21 UTC
From: Larry J. Ford
Topic: 17985  Message: 17985

I am reconfiguring the antenna fed by the AH-4, and thus "re-deploying" the AH-4 to a different (higher) location relative to the shack.

I need to make up a longer length of control cable from the rigs (7200/706) to the AH-4.

I am am aware of this source for pre-made control cable ( http://www.qsradio.com/Rotor%20and%20Tuner%20Cables.htm ), but thought I might try making up the cable myself, both for "fun" and maybe saving a little $.

What's a good source for compatible "raw," unterminated cable, which I understand to be made of 4 inner conductors, each of 22-gauge stranded, insulated copper wire? I guess the outer jacket is water-proof, but is it shielded?

Are the connectors standard Molex 4-pin connectors?

Thanks,

Larry J. Ford

I would think Cat-5 type cable with the appropriate ends would work so you could simply connect the original length together or add in however long of an extension you needed between the two would do the job nicely...

We use a 22/4 cable of different varieties all the time, that's what I'd go for. Be careful with shielded wire though, it's a good measure but if it's not implemented correctly it can cause you more problems than good. Since the all of the AH-4 connectors I've ever seen are plastic you know they aren't grounding a shield wire through it. That being said I doubt theirs is shielded from the factory. If you do decide to use a shielded cable remember to connect the shield wire only at one end (either the chassis of the radio or the chassis of the tuner). Otherwise you'll either have ground loop problems or the shield will act like an antenna and pump RFI into the tuner and the radio.

BTW, the standard 22/4 we use is actually wire used for security systems. We usually buy it in a 500' "bag" for around $35. If you were in Utah I'm sure I could find a length of scrap that I'd just give you but hardly worth the hassle at this point...

Subject: Re: [ic706] Re: AH-4 Control Cable Source

I would think Cat-5 type cable with the appropriate ends would work so you could simply connect the original length together or add in however long of an extension you needed between the two would do the job nicely...

# 17989. Need to replace parts

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-21 03:48:16 UTC
From: n0gmp
Topic: 17989  Message: 17989

Due to some carelessness on my part I've broken the channel change/shift control off of the control head of one of my MKIIGs.
Broke the shaft itself right flush with the face.

Has anybody here replaced that dual control ?
What am I looking at ?

Dave

# 17990. IC706 Missing parts.

From: vk3zaz
Topic: 17990  Message: 17990

I have read about the 2M problem where the radio goes deaf as a post. In my case the losse Power socket has broken the smc coil off the board its gone.
ICOM AUSTRALIA charge $165 per hour to fix.

Can anyone give me an idea what I can solder in there in its place, it is part of the high pass filer.

ALl emails answered vk3zaz@... Thanks for reading.

# 17991. Values of L31 and L27

Hello

First of all I have only used an aftermarket interface with my 706, secondly you don't say if your system WAS working and now isn't or it's a new installation so all my suggestions are guess work.

Have you used the PC serial port and cable before and know them to be good working? Have you used the CT-17 before and know it to be good working? If yes to the above, have you configured the software correctly for comport and speed settings?

Lastly, have you configured the software and radio correctly for the same C-1V address? C1-V parameters can be found in Initial Set mode on the radio.

Sorry if you already knew all this but it's all I've got.

Kav

I would go in via the setup window and make certain that you have the correct hex address in the 706. The Icom designation for the 706 (non II models) is 48h. You will not enter the h in most software programs. It is to designate the value as a hexadecimal value. In some references you will see this value written as $48

# 17996. Digital demodulation and filtering of the IC706 IF

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-23 20:57:06 UTC
From: alexschwarz237
Topic: 17996  Message: 17996

Hi everybody;

I am the moderator of the MDSRadio Yahoo group. We have been developing software for a Windows PC that filters the IF and demodulates it with DSP. Currently we are providing a interface for the Yaesu FT8x7 radios, but now we are in the process to develop an interface for the IC706 and the IC703 transceivers.
The advantage of the DSP filtering and demodulation provides a very clean audio and since it connects to the computer the software provides a spectrum analyzer and a CAT interface, which will be part of the next software release.
This group is non profit and invites people to participate in the development of this new software

Please check out the http://groups.yahoo.com/group/mdsradio/ and also our webpage http://users.skynet.be/myspace/mdsr

Thanks;

Alex

# 17997. Bad DSP noise reduction board? UT-106

Yahoo group: ic706 (2010 — 2015)
Date: 2010-05-30 06:05:21 UTC
From: Moses
Topic: 17997  Message: 17997

Hello,

I have an Icom 706MKIIG.. never really used it on HF until recently (just upgraded to General) and I noticed the DSP/Noise reduction isn't really working. When I turn either the ANF or the NR on, the radio goes into 'mute'. I can still hear faint audio if I crank up the volume almost all the way up. Mode doesn't make a difference, AM/FM/WFM/SSB, neither does the noise reduction level, all work the same way. I tried another 706 at HRO and the noise reduction was working properly on their unit.

I checked all the connections to the factory installed UT-106 module, even checked continuity on all the cabled including the flat board to board connector, no luck. I tried resetting the rig as well. Web searches didn't get me any fixes, although I did find a youtube video detailing the same exact problem.

Anyone heard of this failure before? Anything else I can check? Is my DSP unit just bad? Anyone have a working UT-106 board they want to sell/trade?

Thank you for any help!

Regards,
-Moses

# 17998. power supply for 706mkII amp rating?

yes you would be fine, A power supply that has a larger rating is fine but
you do not want to be too small as it will hurt the PS and the radio.

Dan, just make sure it's 20amp continuous or more. Some manufacturers use what I would call deceptive advertising using peak amps in the model numbers. If you can get a little bigger than 20 for reasonable cost then I would. I would prefer a heavy transformer type but hey let's hear from you guys with switchers. Do you have any birdies ?

Yes.  You can use any power supply that puts out around 12 volts (common used value) with more amps. Most will state around 13.8 volts.  That is a nonial value of a car 12 volt system  with the motor running.

The current rating of a supply is just how much it can supply. It works the same way with the 120 volt wall socket.  Anyting from a cell phone charger that draws almost nothing to a hair dryer that draws almost the maximum current.  That is you can hook any device up to it no mater the current rating of the device as long as it is less than the rated current of the supply.  If you want to you can use  a 100 amp supply with the Icom.  YOu can also hook up several devices to the supply as long as the total at any one time is less than the maximum for the supply.

I have several rigs hooked up to a 50 amp supply that draw a couple of amps on receive and 20 or so on transmitt.  I can only transmitt on one or two at a time without exceeding the total current rating.

Some switchers can generate noise on the receiver.  Also the simple heavy supplies are easy to repair if they ever do give problems.  Do get a supply without a fan as that is just another noise maker and it sucks dust into the supply.

I've used an SEC-1223 switching power supply with an "original" 706 and a 706MKII with no observed problems for over 10 years.

However, I run my 7200 off an Astron RS-35A linear PS because the 7200's current requirements are a little higher than the 706's.

By older 706, do you mean an "original, non-MK, 706?

Why not an ICOM Tuner? The AH-4 works great with the original 706 or the 706MKII that I have.

If you want one for "at the rig," then the ICOM AT-150 will work with the 706s.

LDG and MFJ make "706 compatible" autotuners.

As far as manual tuners, I'm partial to the Ten-Tec 238A which I use with an IC-7200.

The IT-100 is one of the newest tuners from LDG. I've heard nothing but good things about it and it's what I intend to get for my 706 MKII. There are several other LDG products that would work quite nicely as well.

The IT-100 has a tune button on the front and can also be used with the 706's front-panel Tune button also. I believe it comes with the appropriate cables to hook it up the radio.

I have 2 706MIIG's , On one I run an LDG-AT 100Pro. On the other I use an MFJ manual tuner and an 811H amp
The LDG tuners have always worked fine for me

Unless I'm mistaken, all versions of the 706 already have a TUNE button on them. Why would you need to add one?

Jeff -- KE7ACY

----- Original Message ----- From: Robert Traylor

did you have to add a tune button to your first generation icom706 for the ldz-100

The IT-100 is one of the newest tuners from LDG. I've heard nothing but good things about it and it's what I intend to get for my 706 MKII. There are several other LDG products that would work quite nicely as well.

The IT-100 has a tune button on the front and can also be used with the 706's front-panel Tune button also. I believe it comes with the appropriate cables to hook it up the radio.

Jeff -- KE7ACY

----- Original Message ----- From: Robert Traylor

is that ldg=100 discontinued and do i need a interface cable and ad a tune button on my radio

--- On Mon, 5/31/10, From: Jeff Moore <tnetcenter@...>

So what's wrong with the LDG IT-100?

Jess, if you have your technician license, you should be taking advantage of the E-skip season we are in right now. Starts every may. E-skip on 6 and 10. If my memory is correct technicians are allowed on 10 below 28.500 in Texas most action is between 7pm and 10pm. I can give you more info if your interested.there may be some on 2 m ssb as well.

US-licensed Techs have phone privileges on 10 meters between 28.300 MHz and 28.500 MHz, not only in Texas but as far as propagation will take your signal!

I worked the heck out of it last year on a simple 10-meter dipole up about 20 feet, had a blast, and it gave me the motivation to go ahead and upgrade to General in June last year.

However, I've been checking the band regularly over the past month or so, and it seems the band is not open as much as it was this time last year, at least here in SWNC, so I've been spending most of my time on 20 meter PSK-31.

What are others experiencing on 10 meters this year?

Hi Moses,
If yours is an early 'g' model it may not have the DSP. It was sold as an option for a while and then became standard. Pop the hood and see if it is installed or, better yet, does the DSP indicator come on when you turn the filters on in the S4 menu?

God bless

Hi JB,

Yes, it indeed does have the DSP unit factory installed (UT-106). I
checked all the wiring to it as well. Guess its time to buy one and find
out if it is in fact a bad DSP, hopefully its just the module at this
point and not something on the main board itself.
Icom repair stated that it is not a serviceable part (the UT-106 module
itself), I checked it physically without removing any of the shields,
nothing appears appears loose or broken.

So.. anyone have an extra UT-106 they would be willing to sell?

I wouldn't pay a.lot of money for another one because it's just not that good of a dsp. It does help some but you get distortion over level 3. Find someone with a 706 working dsp and make your own mind. Mike R

From: Larry J. Ford
Topic: 275  Message: 18028

Is there a specific frequency that the Atlanta guys hang out on?

I'm about 100 miles NE of ATL (as the crow flies), but with some mountains in between, so probably couldn't hear them on groundwave and probably too short for skip unless the band is really short.

I did work a station in NJ on 17 meters last night, but 10 was dead at my QTH.

The most interesting event of the evening was copying a sailboat anchored at the Galapagos Islands, relaying a medical request from another boat to the Maritime Mobile Net on 14.300 MHz.

Yeah, Moses,
I agree with Mike. It works but not as well as I had expected. There was some dissapointment there. I got a lot more performance out of a Clear Speach speaker. Apart from the DSP being in the IF circuit,it really is the ticket. If you are having to shell out some money, I'd definately go that way. Most accounts have it that the one from West Mountain Radio perform closest to the original from AmComm. A good thing.

God bless

One thing I thought of is the notch filter and I can't remember if that's part of the dsp. I have used that to remove tuner-upers but I can't comment how it works for on cw. Mike R

Hello everyone,

I wolud like to have a duplexer for my 706MKIIG, maybe someone in the group have a suggestion...

What is the best, CF-530 or CF-706A, I know the specs are a little bit different but I whant to know your oppinion?

Thank you.

I would go for the CF-530.

Based on Comet's web page, there's less loss and you can you more power on the CF-530 than the CF-706A.

Hi Eric,
If you are wanting to separate the 6 meter frequencies to a different antenna then the cf-706a is what you need. The cf-530 will not do that.

Now, if you want to send the 6 meter freqs to a triband together with VHF & UHF, then the cf-530c is needed along with the cf-706a.

It works but I would suggest using a separate antenna for 6 meters, especially if your interest is strong for that band. You will get better performance on 6 meters.

God bless

Hello JB,

I already have a GP15 triband antenna for VHF/UHF and 6m, my intention was to use a simple switch antenna before the duplexer to feed my HF antenna.

I don't have any tower at home, all of my antenna are mounted on my chimney. For that reason I would like to have a basic set-up but a good one.

Eric,
I have used the cf-706 with both the IC706 and FT100D on a GP15 with good results for years. The GP15 is a little narrow on 6m though.

From: phil_ad5x
Topic: 18032  Message: 18039

20-25% of max power is about right for SSB when you measure power with a typical SWR/wattmeter. You need a true peak reading wattmeter to accurately measure peak SSB power. A true peak reading wattmeter has a DC-powered peak detector circuit.

Some unpowered SWR/wattmeters claim to read peak power, but they just have a large capacitor that you can switch in for the peak power reading measurment (my Diamond SX-1000 does this). This really just shows average power without a lot of meter wiggling - though the large capacitor can be initially charged to a higher voltage with a high initial power pulse. The IC-706MKII puts out a very high initial power pulse (I measure 140 watts on my IC-706MKII) and this may be what is first charging a capacitor, but then the capacitor discharges to the average power after the ALC in the radio takes control and holds the power to about 100 watts.

I too used a triband and used this duplexer combo arrangement to take 6 meters off the HF side and feed the triband antenna. My screwdriver HF antenna will not get up to 6 meters. I also wanted to avoid too many antennas on my jeep (hf, vhf/uhf/6meters, cb, radio). It was starting to look like a porcupine. =)

With this you will not need a switch. Although a switch may be a bit cheaper, dual duplexers is bonehead proof. Forgetting to have the switch in the right position might have expensive consequenses. Being new to Ham at the time, I was sure I'd screw that up at least once.

But, like I mentioned, if you really want to work 6 meters I would feed to a separate antenna. That tribander is a huge compromise, no matter what brand, that, being a base station, you probably don't need. I even ended up getting a dedicated 6 meter antenna for the jeep and switching to a dualbander for vhf/uhf, thus eliminating the cf-530c (used it on another car). Like CB, I don't use 6 meters very much and store the whips til I need it. VHF/UHF bands should like the dualbander a little better as well.

Just my 2 cents.

I would like to echo what Phil said. On initial key up the 706 has a 100 or some have reported as much as 140w spike. This is the way the designers did the alc. This can be a problem if you want to use some solid state amps, that may trigger the swr protection circuitry of the amp.
Before I got my palstar tuner with peak hold wattmeter, I had to deal with the same dilema. You want to see your 100w radio do 100w right?
One problem is a analog meter movement just can't react fast enough.
The approach I took was if the 706 would do 40 on am and 100 cw,rtty,fm then everything was fine and my diamond wattmeter would show 30,35, maybe 40 at times on ssb. If you have a meter with a 30w scale you should see big swings and if so it's working right. I have found you may need a little more mic gain than alc indicates with my deep voice.
Happy QSO'ing. Mike R

>
> I would like to echo what Phil said. On initial key up the 706 has a 100 or some have reported as much as 140w spike. This is the way the designers did the alc. This can be a problem if you want to use some solid state amps, that may trigger the swr protection circuitry of the amp.
> Before I got my palstar tuner with peak hold wattmeter, I had to deal with the same dilema. You want to see your 100w radio do 100w right?
> One problem is a analog meter movement just can't react fast enough.
> The approach I took was if the 706 would do 40 on am and 100 cw,rtty,fm then everything was fine and my diamond wattmeter would show 30,35, maybe 40 at times on ssb. If you have a meter with a 30w scale you should see big swings and if so it's working right. I have found you may need a little more mic gain than alc indicates with my deep voice.

> 20-25% of max power is about right for SSB when you measure power with a typical SWR/wattmeter. You need a true peak reading wattmeter to accurately measure peak SSB power. A true peak reading wattmeter has a DC-powered peak detector circuit.
>
> Some unpowered SWR/wattmeters claim to read peak power, but they just have a large capacitor that you can switch in for the peak power reading measurment (my Diamond SX-1000 does this). This really just shows average power without a lot of meter wiggling - though the large capacitor can be initially charged to a higher voltage with a high initial power pulse. The IC-706MKII puts out a very high initial power pulse (I measure 140 watts on my IC-706MKII) and this may be what is first charging a capacitor, but then the capacitor discharges to the average power after the ALC in the radio takes control and holds the power to about 100 watts.

# 18048. Fitting a 706IIG in an 08 plate Vauxhall Zafira B

Yahoo group: ic706 (2010 — 2015)
Date: 2010-06-09 18:21:06 UTC
From: Ivan Irlam
Topic: 18048  Message: 18048

Hi all,

This is probably a question for the UK members but I'm not sure where else this vehicle is available.

I need some advice fitting the 706IIG into the Zafira. I am wondering where to route the power lines and mount the main body of the rig.

I envisage having the remote head, mounted on a suction cup mount in the front somewhere.

Any advice greatly accepted. I'm sure someone must have done this before and I don't want to reinvent the wheel.

Thanks in advance.

Ivan (G7WLL)

# 18050. Re: Fitting a 706IIG in an 08 plate Vauxhall Zafira B

Yahoo group: ic706 (2010 — 2015)
Date: 2010-06-10 13:50:07 UTC
From: kav246
Topic: 18048  Message: 18050

Ivan

I ain't done a Zafira but I've done a 93 Astra so some bits of this might be usefull.

The first thing you have to decide is how you want to use the set. If you want to go somewhere/park up/operate then put all the gear in a padded bag in the boot and set it up on the passenger seat when you get there.

If you want to operate mobile it's a whole different ball game. For a start I would forget the suction cup. I never yet found a good place for one and a 706 head aint no 60 gram phone. I did use 3m Duolock (Velcro on horse steroids) in previous vehicles with ample flat surfaces to bond too but this one didn't want to play that way. So I bit the bullet and screwed everything in. BEST THING I EVER DID!

I've used the little elbow type brackets that come with Nokia car kits. I can't recall the number but you'll find them on Fleabay for a couple of quid each. You screw them to the dash then fit your head unit mount plate to the side where the car kit ECU or cradle would go. If you're worried about screw holes then invest in one of the "no holes" plates available for every car and fit the mount to that.

Antenna mounts? Drill it! Again many folk including myself have had success with mag mounts and boot mounts but none were so good as the drilled mounts I have now. I use the Sirio SO239 top to "DV27" or "snail" type 90 deg coax plug. DO NOT use ready made cables. Buy quality plugs/mil spec cable and make your own. These mounts will hold the biggest V/UHF antennas no bother. I use a 7900 Watdiacometson haha and it never budges. You can also get a very strong matching Sirio SO239 - 3/8th adaptor which beats the tin ones. It won't support an HF whip mobile but works a treat when parked. For HF I'm stuck with a tri-mag. This will support an average HF monobander at motorway speed no problem. I've found they don't have enough capacitance for low bands but (only when stationary, for obvious reasons) tipping a bottle of water on the roof makes a heck of a difference. For 20m and up they are ideal. Another trick I used on a previous car was to fit the trimag with a short lead and plug it into one of the Sirio roof mounts nearby. Now that was an improvement. The last thing I would recomend is a remote tuner. Not the matching Icom (unless you already own it). If you can find a used LDG RT11 you're sorted. This may all sound scary but when you demount the porqupines and fit the weather caps the mounts don't look half bad.....honest.

Battery supply? Carry a spare!!!!! Its a cliche but you cant go wrong with an Optima. I found some 75 ahr ones on Ebay. Even there they ain't cheap but they just blow wet cells away. Besides, it's illegal to use wet cells in a Zafira due to gassing as the boot is part of the cabin so unless you can fit a spare in the engine bay you're scubered. So,get an Optima, get a battery box and strap it in properly. That way no one will choke and it wont squish someone in a collision! I also have a heavy(ish) DC feed from the starter battery back to the boot which can run the V/UHF and split charge the auxiliary if the solars (did I mention them?) aren't up to it. Finding your way from the bay to the cabin can only be done by you (or another Zaffy owner) but usually involves climbing all over/under/around the bay until you find the gift given unused grommet where the production robot or jig was

fixed and there you have it.

Now to the trim. Unless they've changed things all the Vauxhall trim panels have little round "dots" or "square groves" every few inches. These are screw covers. What I found was that most came out easily and so long as you noted the length (a very few are odd sizes and must be kept right) all went back in beautifully. The trick is to examine all the trim very carefully, identify all the fixing points first, then REMOVE THEM ALL before trying to release the panel. Be aware that adjoining panels often also have plastic overlaps which also need to be kept right in order for the screw holes to line up. Door and window trim edges may also be held in by sealing rubbers which need peeling back to release. Access to behind the dash area can be gained by removing radios, dash cubbys, glove boxes etc. Just take time and care in both preparation and actually doing the job and it will be OK. This Vauxhall is one of the easiest interiors I've dismantled.

Before you start any of this, sit in the car, with the head unit and try it in various positions till you find the right one. Then look at how you can fix it (Screws/bracket/3m etc). Then, and this is the important bit, find out where the b%**£y vehicle ECU is. I missed this bit and I've paid for it in noise ever since. In mine it's behind the dash above the passenger footwell obscured (hence missed) by the glove box frame. Guess where I ran the head control cable. I might move it one of these days but if you get it right first time YOU won't have to.

Anywho that got a stack longer than I intended it to. I hope it hasn't put you off and that you find some of it useful.

Kav

Try cleaning the contacts on the control head interface. May not have anything to do with what's happening, but seems to be the first step recommended on a 706!

If that doesn't work, have you tried a "hard reset?" That will dump all your memory contents, but may clear the problem as well.

# 18057. Bent Control Shaft on IC-706 MKII - How big a deal?

Yahoo group: ic706 (2010 — 2015)
Date: 2010-06-13 01:00:50 UTC
From: Larry J. Ford
Topic: 18057  Message: 18057

Pulled the dust cover off the IC-706 MKII after not having used it in a while, and found the control shaft on which the concentric AF Gain (volume) and RF Gain/Squelch control knobs sit is bent downward, at an angle, and it impairs movement of the volume control.

Does any one know how bad a repair job I'm looking at?

I have been pleased with the service I got with ICOM Service Center - Michigan (SAR Technical Services), and will likely send it there for repair.

Larry, before sending it in for repair, why not first try to bend the shaft back with a pair of pliers? Be gentle as the brass shaft is not very malleable.

Thought about that, but wasn't sure that it could be done, or that the"mechanically challenged" (me) could do that successfully.

The question is where to get a good grip on the shaft itself or do the knobs simply pull-off, exposing the shaft.

The shaft is bent such that the base of the outer-most knob has pulled away from the faceplate a bit, exposing a part of the shaft right at the base.

Hello Larry,
The exact same thing happened to my 706.
I finally bit the bullet and just pushed upward on the knob on the center shaft slightly, a little bit at a time until it no longer rubbed the outer knob. It must be mounted solidly to the base as it never gave me a feeling that I was about to pry/push it loose. I wonder why I waited so long tolerating the rub?

I use a Force 12 Sigma 5. ( http://www.texasantennas.com/index.php?option=com_content&view=article&id=94&Itemid=106 )
It is really a great antenna. I even take in to field day as it can be stored in a small bag.
I have worked over 50 countries in the past year with this antenna and my 706 on SSB and PSK-31..42

Which vertical antenna would good to order to be used with the 706 ? I can only use 10 meters at this time, but hope to have my general soon.

I see the Hustler and Hygains priced reasonable.

You could make an elevated, groundplane vertical from a 102-inch stainless steel whip (commonly found at Rad Shack or CB stores) by trimming it to the desired frequency, adding 4 tuned radials, add an "RF choke balun," mount it up around 1/2 wavelength or so, and you're ready to go.

For that matter, a 10-meter 2-element yagi is not much more trouble.

The ARRL Antenna Book and articles on the ARRL web site contain lots of examples and info on either verticals or yagis.

Or, contact these folks who can make you a 10-meter groundplane vertical "kit" and send it to you for assembly: http://www.cycle-24.com ; talk to Stan ((870) 743-4027 or (870) 715-8228). He designed and put together all the components for a 20-meter groundplane antenna for me for $75.00, plus shipping.

I have a 10 meter diople 15ft center
and a comet dual band vhf/uhf vert 20ft pole
the 3 element 10 meter beam and the 2 element quad looks good
I just got a wilson wr-500 rotor and control box. When it cools down some I will get something up higher.

I acquired a Gap Titan DX vertical a while back and have been very impressed with it. It allowed me to work Japan, New Zealand, Australia, and a number of Central and South American countries on phone and digital modes. I like it because it doesn't require ground radials - it has a counterpoise that works very well!

Jess I am not wealthy by any shape of the word but have been in the hobby long enough (24 years) to have acquired a few antennas I have dipoles, folded dipoles, beams on the tower, and a couple of verticals in the back yard but I do love my simple wire dipoles in fact I have one that I built that covers about every thing and it cost me a very little to build the center is 3/4" PVC sch 40 pipe 3 end caps and a tee with some stainless hard ware it is 8 wires (4 each direction off center). you can find it in most antenna books or on line Google multi band ham antenna.

# 18070. RE: [ic706] Vertical

Yahoo group: ic706 (2010 — 2015)
Date: 2010-06-14 21:44:29 UTC
From: barry whittemore
Topic: 18061  Message: 18070

There are many antennas that get used by hams around the world. The simple 1/2 wave dipole is a good antenna that can be made very easily and cheaply. I have vertical wires and dipoles for the low bands. The dipole is usually better for local/regional QSOs and the verticals are better for DX. If the dipoles are up high enough they are great as well for DX but its tough to get an 80 meter dipole up that high. high band antennas do not need to be as high to be effective DX antennas.
I have a TA33JR beam at 30 FT and wires for the other bands and have over 200 countries and have my 5BDXCC and 5BWAS awards, this was all done with 100 watts. Put up a wire antenna and get on the air. Get better antennas as you can.
I prefer single band antennas over multiband antennas.
Wire is cheap and effective.
73 and have fun.
Antennas are one area of Ham radio where home brew is alive and well.

Jess, I really depends on the band.
Most hams use wire. It's the most inexpensive if you roll your own. Verticals for other than ten meters are mostly used in small yards and those that have more than one antenna. Lots of folks have a tri band beam for 10/15/20 with other variations of beams and dipole add on kits as well.
There are many reports of happiness with the hustler verticals. Gap has a good following but their three times the price of a hustler. Man made noise is vertical and verticals tend to be more noisy.a wire is usually preffered to a vertical. A flat top wire dipole is fairly bi-directional. Putting it in a inverted v fashion makes it more omnidirectional.if your going to use a dipole for a all band antenna it's best to have a remote tuner at the anteena if using coax or ladder line to a balun and tuner in the shack. Lots of choices huh.
A good antenna homebrew site is www.hamuniverse.com
Good luck and fun in the hobby
Happy QSO'ing. Mike R

yes it is and it covers more than the 4 bands because more than one wire can be resonate at the same time. I do not even use a balun or unun it is just a SO-239 in the PVC with a SHORT piece of wire from the SO-239 to the stainless eye bolts in the end caps.

# 18075. Re: [ic706] Vertical

Yahoo group: ic706 (2010 — 2015)
Date: 2010-06-14 22:12:13 UTC
From: Ralph Mowery
Topic: 18061  Message: 18075

MOst hams run what they can.  For the low bands I would say that a horizontal dipole of some sorts would be the most used antenna.  This is especially true of 80 and 40 meters if they have the space to install one.  While I would not use one, the G5RV type seems very popular.  I use either a full size dipole or an off center fed one for 80 meters and also the OCF on 40 meters.

I do use a triband beam for 20,15 and 10 meters, but it took me a good number of years before I was in position to put up a good tower.  At one house I only had an 80 meter dipole up 20 feet, but was able to do a good job for local (say 300 mile or so ) contacts.

You did not mention the frequencies you were goint to use.  For 10 meters and above the antennas are small enough a piece of pipe or push up pole will hold a beam.

just wondering do most hams use a beam, wire or vertical ?
I would guess wire antennas with tuners. does it make a difference. I am not a dx'er but would like to build ham friendships in Tenn.

I agree, I have an OLD Kenwood TS-120S for the house, an Icom 706MIIG that I use mobile, and in the "GO" kit is an OLD ten tek 555 scout with cards for 80,40,20, and 10 I just do not see a reason for the real big $$ radios I am not a contester. The most expensive radio I have would be one for DStar.

how far are you from radio ? coax or ladder. ?
manual tuner ? I have to be at least 75 from the center for a long dipole. do you have a lighting arrester ?

yes it is and it covers more than the 4 bands because more than one wire can
be resonate at the same time. I do not even use a balun or unun it is just a
SO-239 in the PVC with a SHORT piece of wire from the SO-239 to the
stainless eye bolts in the end caps.

Topic: 18061  Message: 18079

On the same line as Jack, if you had two tall trees close together, I would be thinking a verticle dipole for 10 meters for now. While you are getting your General, do some homework on what your needs and property will dictate for other lower band antennas. Are you on a small lot? Acreage? Apartment? HOA? Adoring wife? =) Those are big factors.

Seems like just about everyone here as different conditions and has adjusted for them in their own way. I am in a tract lot. Got a long wire for reception. Have had a Hustler 5btv vert since day one and have been very happy with it. It is a great little antenna for the money. Careful assembly is very important. The 80 meter resonator works well getting out but I find the long wire receives better and quieter, especially on 80 meters.

I have been playing with some designs for 20 & 40 meters. City ordinances won't let me get a dipole or yagi up over 30 ft. Bad luck for working my dad in Oregon. Have to get creative. Been working on a box ant with the elements shaped like a maltese cross. Space is limited. Looking for a retractable tower. Build a cage ant. Just now dialing in how to get the best going with my limitations.

I would really suggest getting the ARRL Antenna book. There is a huge education in that book. Sure helped me.

Hope that helps a bit.

God bless

My 706 keeps switching off. Sometimes removing the head and cleaning the contacts seems to cure the problem, it will then be ok for a few minutes/hours and then switch off again. Other times it is fine for a few weeks and then the fault unexpectedly occurs again. The problem does not occure when using the separation kit. It's most annoying, has anyone else had this problem?

Do you use the small screw to ground the remote mount cable to the base of the 706MIIG? Mine did the same thing till I cleaned all both ends of the cable and the ends on the head and base unit. Then I put the ground screw in.. Been that way for over 2 years not without any problems..
Good luck to you.

Hi Dan

I don't fit the screw when using the separation kit, but as I said it has never shut down with the head off. It's only when the head is on the radio that it gives this problem. I can switch on, leave it in receive and it will either be ok for hours or keep shutting down, most annoying. I'm sure it is something to do with the pins!

Thanks for taking the trouble to reply, much appreciated.

73 and thanks again

I have the same problem. I am convinced it is heat related. First remove top and bottom covers of rig and ensure all "earthing" springs are making good contact with covers. Make sure rig is well ventilated as it is very prone to shutting down due to reaching temp over 70 degrees. Also make sure you do not have an loop with multiple earthing points causing RF to get into rig and consequently shut it down
When you say switching off do you mean fully off. Mine stays alive in the fault condition but no receive noise or transmit. Does recieve light stay on and does transmit light come on with ptt?
Good luck but focus on the overheating possibility.
Tony

I had an odd one last night. I was on a local 2m net and people complained that my audio was rubbish and overdriven. I could operate with the mic held about a metre from my mouth but something was wrong. I then noticed that, having switched from USB on 20m to FM on 2m, the speech compressor was still on. I had no menu option to switch it off so I had to change modes to USB, switch out the compressor when the menu option was displayed, and then go back to the net. Problem solved. Anyone else experienced this?

Hello Rob,

Yes for me, I have a 706MKIIG and the procedure is the same.

When you switch from HF mode with compressor ON, you absolutely need to switch OFF the compressor before you return on VHF.

If I remember, my modulation settings are level 3 or 4 without compressor to use VHF or UHF band.

Have fun.

Yep -- that's a common "gotcha" on these rigs. I run about 7-8 on the mic gain on FM, no compressor, then turn in on for SSB and adjusted the comp gain (side pot) for a little ALC. That way, I don't have to fool with the mic gain, just remember to switch off the compressor when switching back & forth...

A common thing on the 706's of all varieties. You just have to remember that it needs to be off when using FM. There is no menu option on FM since the COM is not needed there. Judgement call when the menu was designed, I'd guess.

My guess is that you have one of two problems.

One is that the pins on the head/body can get tarnished and need a rub.

I find it's usually the cable end (so may not apply to you unless the head end gets it as well) and I usually just rub the pin tips on the plastic dash which seems to sort it. However when those pins are the problem the rig still tries to fire up if it was off, theres just no display and if it's already on I've never known mine to shut down because of it. I think this is least likely to be your scenario.

However what did knock off an otherwise perfectly functional radio were the powerplug pins. Some genious had the idea to make them with a split up the side which can "splay" with regular removsl/refitting and then also expand with heat. You'd be sitting merrily tuning about (or more likely transmitting) and the thing would just close down. If, whilst removing the head unit, the body moves even slightly in relation to the DC lead the problem will "fix" itself and you automaticall assume it was your pin cleaning that did it.

Just pull out the power plug, take a pair of long nosed pliers and gently nip each pin a little. That should fix it for a good while if you don't remove the plug too often.

If it turns out to be neither then I got no idea but good hunting.

Anybody here had to replace the memory channel switch yet? The inside shaft of the RIT/Mem-ch switch unit ? MarkIIG

I've got a broken shaft on the inside section of the switch and haven't gone into the head yet to see what's going to be involved.

I've replaced the volume/squelch control using a spare bought
from Icom UK. It wasn't particularly difficult. I also bought
an RIT/mem switch for a ham in Hong Kong who asked for help.
They were able to fit the switch to their rig without any
problems. At worst, the replacement process was slightly
fiddly.

I had the exact same problem and it was the DC power connector (female part) loosing up just like you said. I had to take a small screwdriver(very small) and reach inside and close up the connectors inside. Once I did that,just as you experienced, the radio stopped resetting by itself. At the time, I was doing a lot of testing in my pickup and removed and reconnected the DC power cable several times from the radio. I thought the power connector was loose inside the radio. (it does have some wobble) but, that wasn't it at all.

Thanks for all the replies, Icom have suggested cleaning the head/body contacts and perhaps re tensioning them and I have nipped the DC power connector sockets as suggested by a number of contributors. The radio switches off completely, so perhaps it could be the DC power connections after all, we will see this next few days.

Luckily the radio is still under warranty till mid August 2010, but I'm reluctant to send it back to Icom UK when it is an intermittent fault, chances are it won't shut down on the bench when you want it to!

Thanks again everyone

I used to fit/remove the rig every trip but that shoudn't have put undue strain on the connector as it was rarely touched. The RF deck, an LDG RT11, the Icom inline filter and all conections are mounted to a board which lifts out as a unit. I have all my radios fitted with 30amp two way "t" connectors (down wind of the inline filter on the 706) similar to those supplied with most VHF rigs.

The radio does get less use these day but it must be 5 or 6 years since I "fixed" that plug and I've never had to do it again.

# 18102. CI-V port competition

Yahoo group: ic706 (2010 — 2015)
Date: 2010-07-06 02:54:06 UTC
From: marklfriedlander
Topic: 18102  Message: 18102

I've been thinking of buying a Turbo Tuner screwdriver antenna controller to use with my 796MKIIG base installation. This controller uses the radio's CI-V port but so does my computer for radio control when using digital modes.

Would a "Y" cable work? Does either the data or acc ports also support CI-V?

Does anyone have any suggestions for dealing with this conflict?

Thanks,
Mark KV4I

The only times I had that problem was when RF got into the rig.

One time, I was using the separation kit on HF with a poorly grounded shack. The other time was with the face plate connected to the radio and I was using a VHF antenna in the room.

I'd look at RF as the culprit.

Hi Mark,
I run a 706MIIG in my Jeep with a Turbo Tuner.. It works well.. I run a Tarheel 2 antenna... I did use a Y cable.. Just make sure the Y cable you use is a Mono style cable.. I could only find a Stereo Y cable.. So I used some mono adpators off each end... So Now I have the Turbo Tuner and CAT cable for my Laptop... Hope this helps.. If you need any help let me know I can go take a closer look at mine just to be sure what I have..

Dan,

I found a cable for $5.95 (free shipping) at
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190413619051&rvr_id=&crlp=1_263602_263622&UA=%3F*S%3F&GUID=9007fa891290a0aad3e3fea3fe906ddd&itemid=190413619051&ff4=263602_263622#ht_500wt_928

<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=190413619051&rvr_id=&crlp=1_263602_263622&UA=%3F*S%3F&GUID=9007fa891290a0aad3e3fea3fe906ddd&itemid=190413619051&ff4=263602_263622#ht_500wt_928>However,
I just realized that the Turbo Tuner manual calls for a 300 baud CI-V
setting while MIXW can't do less than 1200. What are you using on your
laptop and at what speed?

Thanks,
Mark KV4I

# 18110. Icom AH-3 antenna tuner and other items FS

Yahoo group: ic706 (2010 — 2015)
Date: 2010-07-08 17:58:29 UTC
From: Ken Simpson, W8EK
Topic: 18110  Message: 18110

Icom AH-3 Automatic Antenna Tuner For Sale:

The Icom AH-3 automatic tuner will tune continuously from
1.8 MHz through 30 MHz, i.e. from the low end of the 160 meter
band to top of the 10 meter band, including 60 meters and
all WARC bands. The AH-3 is a full HF tuner. Note that the
newer Icom AH-4 tuner is not listed to tune below 3.5 MHz,
while the the AH-3 is. It requires at least 5 watts to
automatically tune, and will handle up to 120 watts.
It requires 13 V DC to operate.

The AH-3 works with any Icom radio with standard 4 pin
rear tuner connector, such as the Icom 703, 703+, 706 series,
718, 746, 746Pro, 756 series (including Pros), 7000, 7200,
nd many others. It can also be used with most any other
radio with a simple interface (information provided).

This AH-3 is in excellent condition. Paper work is included
for $200.

Other Icom Items For Sale:

Icom HM-12 hand microphone
The HM-12 has a round 8 pin connector on it, and includes
up-down switches on the top and a lock switch on the back.
It is used with most of the modern Icom rigs using a round
8 pin connector.
The mic works as it should, and the mic itself looks very,
very good. The cord has seen some of the Florida sun and
has some deterioration. $40

Related items:

Communications Speaker:
This 4 inch square speaker is optimized for communications
frequencies (300 to 3000 Hz). It is in a black enclosure,
and is an 8 ohm speaker. It has a cord with a 1/8 inch
(3.5 mm) mono plug on the end.
This one works fine and looks OK also. $15

Dual Meter SWR Bridges:

These feature two separate meters -- one for reading forward
power and another for reading SWR. This permits one to easily
monitor both the power going out, and the SWR on the antenna.
They are from Japan, and labeled with various names, including
Swan, Siltronix, and Quement. Both have SO-239 connectors on

each end, and work fine.

Both will work on HF, and VHF, covering 3 to 150 MHz, so are ideal for the new rigs that include 6 and 2 meters.

Swan SWR-1
This one is in its original box, but the meter itself says Siltronix on it. The original instruction sheet has both Swan and Siltronix on it. $45

Quement SWB-2
No box for this one, but it works fine and looks great. With paper work for $40

SWR Bridges / Field Strength Meters:

Midland 23-126 SWR Bridge / Field Strength Meter
This is an HF SWR Bridge, but it can be used up thru 2 meters, with slightly reduced accuracy. It is also a field strength meter. SO-239 connectors.
This one works fine, and looks extremely nice. I do not see any scratches on it; it may not have ever been used. In its original box with original instructions and small telescoping antenna. $35

ThordTest SWFS-2 SWR Bridge / Field Strength Meter
Appears to be the same as the Midland above, but the outer case is beige instead of black.
In original box, with original instruction sheet, and antenna. $30

Heath HM-2102 VHF wattmeter, covering 50 to 160 MHz.

Similar to the HM-102, but for VHF frequencies, with 250 and 25 watt scales. It can also be used to check SWR, and has a remote sensor that can either be left inside the meter, or separated from the actual meter.
SO-239 connectors in and out.

This particular meter works great. It looks good, but has a small defect on the left side of the meter that does not effect operation.

Paper work included for $40.

Lightning Protectors:

"Blitz Bug" Lighting protectors
These are not as sophisticated as the Polyphaser below, but still protect against lightning. Two versions are available. One has an SO-239 connector on each end. The other has a PL-259 on one end and an SO-239 on the other end. Take your choice for $8 each.

Polyphaser IS-VU50HN-MA Lightning Protector

Polyphaser is well know for extremely good lightning
protection equipment. This coaxial antenna protector
is designed to be inserted in the coaxial cable at the
bottom of a tower.
This unit has two SO-239 connectors, and is rated to take
750 Watts from 50 to 300 MHz and from 380 to 550 MHz.

This particular unit includes the spec sheet, and appears
that it might not have been used. It is not oxidized,
or corroded.

These sell for about $75 new. Buy this one for $55.

ORIGINAL Icom operating manuals:

Please note that all of these are original Icom manuals and
are not copies. All are in very good condition.
These are original manuals only.

BC-30 Desk Charger $5
BC-35 Desk Charger $7
BP-2, BP-3, BP-4, BP-5 battery packs $3
BP-21, BP-22, BP-23, and BP-24 Batteries $3
DC-1 DC pack for IC-2 AT series HTs $4
HM-8 Hand Microphone, w/schematic $5
IC-22 S, 2 m FM transceiver $12
IC-229, 2 meter mobile transceiver $15
IC-3 PA Power supply / speaker $10
UT-16 Voice Synthesizer $5

These are original manuals only.

Prices do not include shipping from Florida.

Thanks.

Thanks Mike for your replay

Yes i did a full system reset and still.
as i said i put the main board from the bad 706 to another known good working 706 and shows the same problem, so it must be something wrong within the main board. i also did the c1022 vco adjustment but still.

any idea???

Thanks

Have you turned down the mic gain and turned off the processor when going to FM ?  It seems that most 706s need to have the mic gain turned way down on FM compaired to the setting for ssb.

--- In ic706@yahoogroups.com, Mark Friedlander <marklfriedlander@...> wrote:
>
> Have you ruled out the settings by doing a full system reset?

Thanks Mike for your replay

Yes i did a full system reset and still.
as i said i put the main board from the bad 706 to another known good working
706 and shows the same problem, so it must be something wrong within the main
board. i also did the c1022 vco adjustment but still.

any idea???

Thanks

From: pedroafonso2
Topic: 18112  Message: 18120

i think i found the culprit. its ic981. it takes care of fm and am signal from mic. pin 1 should read 4.4v (as service manual)and its read 7.21v. i measure the other good working icom 706 and the voltage there is 4.4v. so ill give it a try. will order that ic from icom today.

Thanks everybody for the help. i will let you guys know .

# 18121. Icom 706 audio receive/transmit failure - first intermittent then total.

Date: 2010-07-26 10:15:25 UTC
From: Tony
Topic: 18121  Message: 18121

After many months of intermittently losing audio and transmit functionality, my 706MK2G finally gave up the ghost on our club field day last week.For those who may be interested or suffering similar problems, which I had put down to overheating, here is an account of my solution:
I think I have fixed the ol' 706 after it's cerebral event on Field Day:Logic took me to the HPF board which sits in an aluminium container on main board.(see circuit below)On removing covers, set came to life. Before getting the scope out, some physical probing of of the main board revealed that slight downward pressure on the main board (as produced by the springs on the cover would do) brought on the fault condition. Broken printed circuit or dry joint I thought. Reflowed solder joints on HPF aluminium screen can seemed to help but not fully. This board has to come out I thought, looking woefully at all the ribbon cable connections etc. Bravely onward with a huge magnifier I moved. Out came the main board revealing yet more "earthing type springs and an aluminium sub chassis. How much gap between bottom of circuit board and chassis I thought?(see drawing below) so sat circuit board on a flat surface which revealed the problem. Five pins of components soldered on top surface of circuit board in the region of HPF board had not been cut off during assembly and were so close to the chassis that even fingertip downward pressure on the board caused a short. I am assuming that pressure on the outside case, heat or even a hot day was sufficient to cause expansion and downward pressure on the board. I also assume that without the excess pin length (which should have been removed on production) the clearance is sufficient!I don't think there has been any long-term damaged caused but who knows.She's been on soak test for a couple of hours now and I spoke to Andrias in Russia for ten minutes, so here's hoping.Hmmmmmmmm!

I want to get an autotuner for my MKII, and I would appreciate any comments or suggestions anyone here has to offer on the subject.

The tuners I'm looking at are the AH-4, MFJ-925, and the LDG IT-100, but I am open to any others that you think deserve consideration.

Thanks, and 73
Bob

ICOM makes "Plug N Play" tuners. No need to twiddle.

I use the AH-4 in my HF 706MKiiG mobile.

I've been looking into this too. Here's what I've seen in my research.

I believe that the AH 4 and the AT 180 are designed for different applications. I've read that the AH 4 is designed for random wire and whips as the wire connecting to the tuner becomes part of the radiator. Many folks seem to like them with 102" CB antennas on their mobiles. I've also read that the AT 180 doesn't have as wide a range in tuning capability as the It 100. In other words some folks claim the IT 100 can tune when the AT 180 can't.

You might want to check out the reviews at eham.net

Bob, that's a big can of worms. If price is not a object the icom may be the best. I don't use a auto tuner anymore, I just love my palstar manual. I've got a ldg on the shelf and it interfaces well. I have wondered if the 200w models might be more efficient. Are you going to use it mobile or fixed? If fixed you might also consider a remote tuner so all your power gets to the antenna. The mfj stuff is a mixed bag with some happy and some not. I try to buy elsewhere if possible.

From: Randy Ross
Topic: 18122  Message: 18127

At my QTH, I use the AH-2. When at a remote site, somewhere, I use a LDG IT-100. BUT: I put the IT 100 in a weather-tight box at the base of whatever antenna I am using. The molex ends for the tuner controller can be purchased from Radio Shack and I use the flat four-wire trailer light cable for the 'control cable.' In my area, Northern Tool has 100' spools of 16Ga, 4 wire trailer hook-up wire for just over $25. So, I end up with a rather good "remote" tuner for under $150.

In any case, if I am using a tuner, I would always try to use a remote tuner.

Mobile use or fixed base use?

If the former (mobile), the AH-4 is hard to beat for its compatibility with the ICOM line of transceiver.

I have two AH-4s; one for an up-coming mobile install in which it will be mounted at the base/feed point of a vertical; the other is for home use for long wires, "V" beams, and even feeding doublets via balanced line.

Mobile uses include portable use for NVIS antennas for ARES and public event purposes.

From: Norman
Topic: 18133  Message: 18133

I have been very happy with my Icom AT-180. Matches the '706 and has taken a lot of abuse, including overseas travel.

It matches my Alpha Delta 100' long 160-80-40 meter dipole instantly.
When using my Force 12 C3SS it stays out of the circuit on 20, 15 and 10.
When using the beam on 12 and 17 it tunes right up.

Hi Bob,

I have an IT-100 that I use with my 706MKIIG that works good, no problems so far. I'm using it with a Camelion V1 antenna and, with counterpoise as recommended, it seems to tune all they way between 6 and 80 meters without much trouble. Without counterpoise is a little bit hit and miss.

I haven't used the other tuners so I can't compare though, only to say the IT-100 has been working good for me.

Bob,

You have received lots of input. I don't think I could make a decision based on all of the great recommendations.

For a mobile setup an auto tuner and one or more center loaded antennas will work moderately well. If multiband mobile operation is to be your main operating activity, then a multi-band screwdriver class of antenna should be preferred. With the screwdriver type antenna there is no need for a tuner. Screwdrivers are moderately expensive. Multi-band mobile operation with a CB type whip and an auto tuner is possible but results will be disappointing on 160, 75 and 40 meters.

IF base station operation will be your major mode then there are many, many options from automatic tuners to manual tuners. I own and use three [3] very old manual tuners from 35+ years ago on my various HF radios feeding center fed doublets, NOT RESONANT DIPOLES, on all bands 160 through 10 meters.

My VSWR on 75 meters exceeds 30:1. My manual tuner and feedline losses are slightly over 1 dB measured. BTW: the manufacturer is/was MURCH Electronics, now out of business due to death of proprietor.

Any tuner does NOT tune the antenna! There will still be a VSWR in the feedline between the antenna and the tuner if the antenna actual load is different from 50 ohms [the Zo of the feedline]. This VSWR causes energy loss in the feedline. All tuners have a specified range of VSWR where they are effective. Some will tune less than 3:1. Others will tune less than 10:1. Still others are infinitely adjustable. Price varies with tuning range, manual or automatic.

Any tuner converts the impedance caused by the VSWR to the characteristic impedance, Zo, of the feedline between the tuner and the radio. Also, the tuner introduces a small amount of signal loss [~ 1dB +/-].

Take these guidelines, look at your checkbook, talk with your XYL, argue with your XYL, give up discussions with your XYL and buy a tuner that meets your needs. :-)

DD, W1MCE

"Any tuner does NOT tune the antenna! There will still be a VSWR in the feedline between the antenna and the tuner if the antenna actual load is different from 50 ohms [the Zo of the feedline]. This VSWR causes energy loss in the feedline."

This is why I like the idea of the AH-4 or any other remote autotuner that can be mounted at the feedpoint of the antenna, as RF energy loss in the feedline (coax) between the rig and the AH-4/remote tuner will be minimal.

Granted, even with a tuner at the rig and low-loss coax, the loss may be minimal, but on longer runs it can still add-up and sometimes every little bit counts! It just seems to me that the feedpoint-mounted tuner will be more efficient.

I guess you "pays your money and takes your choice!"

Subject: Re: [ic706] Autotuner recommendations please.

Bob,

You have received lots of input. I don't think I could make a decision based on all of the great recommendations.

For a mobile setup an auto tuner and one or more center loaded antennas will work moderately well. If multiband mobile operation is to be your main operating activity, then a multi-band screwdriver class of antenna should be preferred. With the screwdriver type antenna there is no need for a tuner. Screwdrivers are moderately expensive. Multi-band mobile operation with a CB type whip and an auto tuner is possible but results will be disappointing on 160, 75 and 40 meters.

IF base station operation will be your major mode then there are many, many options from automatic tuners to manual tuners. I own and use three [3] very old manual tuners from 35+ years ago on my various HF radios feeding center fed doublets, NOT RESONANT DIPOLES, on all bands 160 through 10 meters.

My VSWR on 75 meters exceeds 30:1. My manual tuner and feedline losses are slightly over 1 dB measured. BTW: the manufacturer is/was MURCH Electronics, now out of business due to death of proprietor.

Any tuner does NOT tune the antenna! There will still be a VSWR in the feedline between the antenna and the tuner if the antenna actual load is different from 50 ohms [the Zo of the

feedline]. This VSWR causes energy loss in the feedline. All tuners have a specified range of VSWR where they are effective. Some will tune less than 3:1. Others will tune less than 10:1. Still others are infinitely adjustable. Price varies with tuning range, manual or automatic.

Any tuner converts the impedance caused by the VSWR to the characteristic impedance, Zo, of the feedline between the tuner and the radio. Also, the tuner introduces a small amount of signal loss [~ 1dB +/-].

Take these guidelines, look at your checkbook, talk with your XYL, argue with your XYL, give up discussions with your XYL and buy a tuner that meets your needs. :-)

# 18139. Re: ic-706mk2g muffled audio when transmitting on fm/am

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-04 23:39:27 UTC
From: pedroafonso2
Topic: 18112  Message: 18139

The problem was muffled audio only on Am and Fm modes at any band.
The thru hole that connect pin 4 of IC981 (vcc+) with R984 had rust in it and it didn't conduct, was short it out.
So i solder a piece of wire between pin 4 and R984 on the other side of pcb. And it worked nice and clean.

# 18140. Re: Autotuner recommendations please. Thanks to all.

I want to thank each and every one that responded to my query. As Deacon Dave pointed out, I, "have received lots of input" and yes, it is going to take some time to come to a decision on what to buy.

Some have asked about how I intend to use it. My primary need and initial use will be at home. Because of restrictions, I had only worked from my vehicle in the past using a 102" SS whip antenna and a Drake tuner, (MN4?) that allowed me to get a good match on 20 through 10 meters. I got rid of the car, but may be installing a setup in a van in the near future, so it looks like I'll be buying a second tuner before long. I am worried about the close proximity of the antenna to the van should I use a bumper ball mount. That's a bit farther down the road time wise. For now I'm planning my base setup and will worry about the mobile installation when the time comes.

Again, thanks to everyone that took the time to share their thoughts and experiences. I really appreciate it.

73,
Bob

This was Copy and Pasted from QRZ.com

The 706MKIIG radio has 2 different versions of the PA

board. The older PA board's finals (1590002690)aka

(srfj7044) are no longer available and would require

replacement of the PA board. The newer style PA board

transistors are part# 1560001190 (rd70HVF) and can be

ordered by The 2 styles of transistors are not

interchangeable.

The complete PA board is part# 98413600 and sells for

apx $442. The catch 22 is that this board is the old

style board, with the old transistors. We do not have

the new style boards available yet so, if the finals

fail again, it's another board replacement.

I've ordered the new style transistors from rf parts. $30 a piece. Hf still works. VHF/UHF uses the same part as a single. It looks like the hf finals have been very hot as well because flux is oozed out. I don't know if that's normal. They are going to get hot but what's too hot. On the VHF it got hot enough to melt the solder and do some damage to the board. I don't know if the part failed or entirely heat related.
on my other 706 mk2. No g. I have reduced power to be on the safe side.

Hi Peter

I keep having the same problem, I posted it on the 706 forum, which you can check and I also asked for help from Icom UK. Try cleaning the pins on the head unit and also check the power plug lugs to see if they are a good fit onto the socket. I think that you will find that the problem is one of these or perhaps both. I found the problem is most frequent after I have taken the radio out of the shack for portable use, when I use the separation kit, it works fine till I bring it back into the shack and fit the head unit and re connect it to my power supply. Icom suggested re tensioning the pins on the head unit, but didn't say how to do it.

My 706 is under warranty till mid August but since it is an intermittent fault I'm reluctant to return it to Icom as you can bet the fault won't occur when it is on test!

Hope these comments help

Hello!

My 706MK2G goes deaf, but a littlebit different way as here has been wroted.

My 706 works couple minutes fine, then i can hear relay saying "click" and then it goes absolutely deaf and signal meter starts showing S9+60dB.

When i´m trying to change a band, i can´t hear band changing relay working. After turning rig off for a couple minutes, and when i turn it on, signal meter goes slowly to zero and same time i start to hear noise as normally.

I´ve tried to spray rig with freeze spray while it is on "fault-mode", but witout help...or i have to say it worked about month fine, but then it started to go deaf. I didn´t locate broken soldering.

How many conductors are in the cable?
I have some 8 conductor flat cables E/W RG-45 connectors on each end.
They were made for the AT&T phone systems for under carpet use. They are 25 ft long.
Let me know if this would help you out. If the connectors are wrong they could be changed out to something else.

A few guesses assuming you have checked the obvious....

Bad squelch pot? (RF gain in HF)

How does it work in FM?

There is a little ribbon cable in the head that connects the pots to the main board of the display that may have become loose

Hello and thanks for reply!

OK, i´ll have check that cable...

My 706 doesn´t work on any mode or band. Rig doesn´t also transmit.

Well, i just removed/cleaned 3 flat cables that are a bit up from filters. I think there´s some bad soldering on pcb. When i pressed pcb right side of these cables, i could hear relay "click" and "clack". "clack" is sound for malfunction goes off...

# 18167. Serial numbers for 706 MKII

I'm confused with this question. I would assume they started over numbering with each change but maybe not? I have a 2 and a g. No idea as to the age of the 2 it's number 9843. It says mk2-a

Happy QSO'ing. Mike R

I guess I'm wondering how many were made. I saw one with a 01100 serial number. Must have been close to the beginning of the model.

A lot of manufacturers will use a simple date code as part of the serial number. If the 9842 is part of a longer code, then it might mean it was manufactured in the 43rd week of 1998. My 706MkIIg isn't right here or I'd check it and see what it says. I bought it in Sept 2001, so if the suspected date code portion said something like 0026 it would mean it spent a lot of time on a warehouse or store shelf before it was sold to me - which wouldn't be surprising.

I've never heard a reference to that way of numbering for any icom rigs and the manufacturers that do try to keep it secret.

# 18173. My MKIIG crash

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-16 19:18:44 UTC
From: ivan
Topic: 18173  Message: 18173

I do not know the problem (¿?) my MKIIG have a few time trasnmiting and receiving perhaps 100 hours turn on and transiting I think 10 to 15 hours is really as new.
When I turn on after 10/15 minutes do not receive do not transmit (¿?)
I reset the trasceiver push (down-up and the power on) some time the s meter go to 60 plus ++++++ (¿?) after I go the power off and past 15 minutes reset again but the problem persist, I look the Tech notes from "Mike Nadeau - N1EQ" and I do not know if the problem from diodes or trimmer´s or other (¿?).
Any can help, ......(¿?)

# 18178. Need Help With IC-706 original model

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-19 05:17:16 UTC
From: r390b
Topic: 18178  Message: 18178

I keep asking for assistance over the years on several of the Icom groups, but will ask again.

I am in need of a good copy of the PC board layouts for the old 706. There are several online, including Icom's manual site, but the board layouts are unreadable. (like they were scanned at too low a res, or saved as a jpg at too high a compression, that sort of thing.)

I have the factory service manuals for the MkII and MkIIG (or at least did...) and they were very easy to read, quite crisp, etc.

The problem I'm having appears to be common among the original 706 -- the bandpass filter board is intermittent on several bands, dead on others, etc. No problem with the main board itself, it is sending the correct signals. The problem is with the relays, diodes and switching transistors on the BPF board and I'd like to repair the darned thing -- as Icom no longer will do so. (and I don't blame them!!)

My plan is to use similar, but uprated switching transistors and steering diodes and attempt to find some common relays to replace those that have a problem. Luckily I can still change bands "manually" using clip-leads, so my relays appear to be OK, the problem seems to lie in the transistors and such.

Why am I wanting to put so much work in an old radio like the original 706?? Because I can. I have an IC-7000, and several other newer radios and a shelf full of modern military radios, but I have service literature on most of those, and they all work. The poor little 706 has been sitting unappreciated for quite a while and is starting to look even more pitiful as more and more dust accumulates over the years.... heehee

If I find a good easy fix to the generally unreliable thing, I could help others with the same problem, or maybe even have a spare working radio to give to a new ham who can't afford one. Your help with my project could make such a thing a reality. (hmmm, I've been reading too many marketing textbooks over the years, now I'm starting to sound like a salesman or something... I assure you I'm not. LOL)

Anyway, whatever help anyone could spare would be greatly appreciated.

Best 73

Tom NU4G

I don't know for a certainty, but I think I read that the detachable control heads are NOT interchangeable between models.

I have both an "original" 706 and a 706MKII, and there are different implementations of certain function buttons (e.g., the "Memory Channel" button), so I think that's one reason they are not interchangeable.

Hello

I had a brief test with a mk11G head on a standard mk11.

It lit up, the tuning control worked and so did the band and mode buttons.

Thats all I got to check.

No scientific reason for checking. We could so we did. It was a quiet day haha!

# 18183. FS: Icom 706mk2g & Z-11 Pro tuner...

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-20 18:10:32 UTC
From: Bob Pariza
Topic: 18183  Message: 18183

For Sale: Icom 706Mk2G

A very nice, clean 'Mk2G, serial #021xxx. This radio has the optional narrow SSB filter (FL-223) and the optional carrying handle (MB-72) installed. It also has the HM-118TN microphone with tones. When I got this rig I took it to our local tech who went through it and made certain that everything was operating correctly and within specs. He also did the 60-meter mod. This is really a great radio and has seen almost no use since I've had it.

The price is $725, double boxed and shipped to your door (in the lower 48) via UPS ground. Pictures are available upon request, questions are welcomed.

Also For Sale: LDG Z-11 Pro Antenna Tuner

A very clean Z-11 Pro tuner. The box is marked "blemished" and the only flaw that I can find is one small chip on the corner of the cover, just above the upper-left corner of the front panel. This tuner works just great and is a terrific partner for the '706. It's small, fast and easy to work with. I bought this tuner new and it too has seen almost no use.

The price is $125, double boxed and shipped to your door (in the lower 48) via UPS ground. Pictures are available upon request, questions are welcomed.

Buy both for $825, again double boxed and delivered in the lower 48 via UPS ground.

If you have any questions or want to make an offer, please contact me off-list @ bpariza at yahoo.com.

Thanks, Bob

I have the 706 and a MK2G and the heads do operate on each other's radios.

You won't get a DSP menu for the 706 (should be no surprise)

I think the RIT worked OK but cannot remember that part exactly. You won't get the RIT rotary encoder to change memories though, but thats no surprise as the 706 never did this anyway.

Fortunately all the other functions appeared normal.

# 18185. ICOM IC-706 MKII - Tuning Knob Does Not Work

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-22 01:25:29 UTC
From: Larry J. Ford
Topic: 18185  Message: 18185

I just got my 706 MKII back from the repair shop (sent in for a bent AF/RF Gain control shaft), took it out of the shipping box I got from the shop, hooked it up, turned on the power, and found that the Tuning Knob does not work in any function - not for frequency tuning nor for any of the submenus, such as setting power.

I tried switching the "Lock" button on and off several times, but that has no effect. Should I try a full system "reset" or is there something else I can try to see if there's a simple solution.

If not, I guess I have to send it back to the repair shop. Bummer.

Thanks,

Larry J. Ford

Matt,

Got the above items by UPS yesterday. Thanks for the quick turnaround.

Now I've got another issue. Found a used ICOM AH-2b mobile antenna setup for sale. However, it is missing what the AH-2b documents call the "antenna element holder." (See attached PDF, top left corner for illustration.)

The element holder is what the whip antenna slides into, the whip is tightened down with hex screws, and then the element holder screws into the spring base and is tightened down.

Can you get this as a replacement part, and how much would it cost? Need to know before I try to make a deal with the seller of the AH-2b.

Thanks.

Matt,

Wasn't trying to bug or rush you, just looking for an update. Later this month will be fine. I would like to have both units back later this month, if possible, you don't need to order parts, etc.

I have an event in September, a 100 mile bike race through the mountains of North Georgia [1], that I provide HF NVIS communications for in a really tough spot deep in a valley in the Chattahoochee National Forest where no cell phone, VHF, or UHF comm will work. It's at the foot of a long run down a 4000 foot high mountain, the bikers get up a real head of steam coming down, and they had a fatal crash there a few years ago. I use the 706 MKII and this year plan on using the AH-4 for my comm set-up there.

Matt,

Kept getting a busy signal on your phone, so I thought I'd try e-mailing.

I know from the postings on eHam and our last phone conversation that you're "buried" with repair work due to storms in the Midwest and going to ICOM school, but I'm wondering if you've had a chance to look at the 706 MKII and AH-4 I sent in July?

If not, any time frame that you can pass along?

Do you need a credit card number?

Thanks,

Larry J. Ford

I have that very problem, of course I did not send my radio anywhere for repairs yet. If you find out what is causing it, please share. I did try a reset and that did not fix it by the way.

Subject: [ic706] ICOM IC-706 MKII - Tuning Knob Does Not Work

I just got my 706 MKII back from the repair shop (sent in for a bent AF/RF Gain control shaft), took it out of the shipping box I got from the shop, hooked it up, turned on the power, and found that the Tuning Knob does not work in any function - not for frequency tuning nor for any of the submenus, such as setting power.

I tried switching the "Lock" button on and off several times, but that has no effect. Should I try a full system "reset" or is there something else I can try to see if there's a simple solution.

If not, I guess I have to send it back to the repair shop. Bummer.

# 18189. Re: [ic706] ICOM IC-706 MKII - Tuning Knob Does Not Work

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-22 15:41:39 UTC
From: Larry J. Ford
Topic: 18185  Message: 18189

Bingo!

I had sent an e-mail to the repair shop just before posting to the list, and subsequently got an e-mail back from the owner stating it was most likely the encoder and asking that I send only the control back. He also apologized for the inconvenience. (I hope that means I won't be charged for the repair if they did something like not resoldering the encoder back.)

I guess if it is the encoder, and he only wants the control head back, that the encoder is mounted to a board in the control head?

The repair it was sent in for was to repair/replace a bent AF/RF Gain control shaft.

I think this MK II rig is "cursed." I have an original 706 which has worked perfectly since Day 1, and has never seen the inside of a repair shop (knock on wood). Of course, it has never been mobile or field duty, either.

But this MK II rig is a different story. I bought it from another ham who said it was working perfectly. However, when I got it from him, it would not transmit on FM, so I sent it in for repair. Because the repair shop described the problem in writing and stated that it was not something that could have happened suddenly, but would have developed over a long period, I did get the other guy to pay the repair bill. Then the AF/RF Gain control shaft mysteriously turned-up bent. Now this. This will be the rig's third trip to the repair shop in a year. Well, hopefully, the old saying is true that "Third time's charm!"

Subject: [ic706] ICOM IC-706 MKII - Tuning Knob Does Not Work

I just got my 706 MKII back from the repair shop (sent in for a bent AF/RF Gain control shaft), took it out of the shipping box I got from the shop, hooked it up, turned on the power, and found that the Tuning Knob does not work in any function - not for frequency tuning nor for any of the submenus, such as setting power.

I tried switching the "Lock" button on and off several times, but that has no effect. Should I try a full system "reset" or is there something else I can try to see if there's a simple solution.

If not, I guess I have to send it back to the repair shop. Bummer.

Thanks,

Larry J. Ford

Subject: Re: KG4GPJ - ICOM IC-706 MKII and ICOM AH-4

Matt,

Got the above items by UPS yesterday. Thanks for the quick turnaround.

Now I've got another issue. Found a used ICOM AH-2b mobile antenna setup for sale. However, it is missing what the AH-2b documents call the "antenna element holder." (See attached PDF, top left corner for illustration.)

The element holder is what the whip antenna slides into, the whip is tightened down with hex screws, and then the element holder screws into the spring base and is tightened down.

Can you get this as a replacement part, and how much would it cost? Need to know before I try to make a deal with the seller of the AH-2b.

Thanks.

Good Morning:

Hello Larry:

That shouldn't be a problem. I should have them serviced in a couple of weeks. Sounds like a very interesting event.

Matt,

Wasn't trying to bug or rush you, just looking for an update. Later this month will be fine. I would like to have both units back later this month, if possible, you don't need to order parts, etc.

I have an event in September, a 100 mile bike race through the mountains of North Georgia [1], that I provide HF NVIS communications for in a really tough spot deep in a valley in the Chattahoochee National Forest where no cell phone, VHF, or UHF comm will work. It's at the foot of a long run down a 4000 foot high mountain, the bikers get up a real head of steam coming down, and they had a fatal crash there a few years ago. I use the 706 MKII and this year plan on using the AH-4 for my comm set-up there.

Matt,

Kept getting a busy signal on your phone, so I thought I'd try e-mailing.

I know from the postings on eHam and our last phone conversation that you're "buried" with repair work due to storms in the Midwest and going to ICOM school, but I'm wondering if you've had a chance to look at the 706 MKII and AH-4 I sent in July?

If not, any time frame that you can pass along?

Do you need a credit card number?

Thanks,

Larry J. Ford

I don't know for a certainty, but I think I read that the detachable control heads are NOT interchangeable between models.

I have both an "original" 706 and a 706MKII, and there are different implementations of certain function buttons (e.g., the "Memory Channel" button), so I think that's one reason they are not interchangeable.

How did you know it was Matt?

Anyway, looks like he's going to make good on it, plus sell me an "antenna element holder" for an ICOM AH-2b antenna system at his dealer cost, but he's that kind of guy. That's why I keep recommending him.

ICOM America wanted $107.76 for a stainless steel part that's about 4 or 5 inches long; its screws into the spring mount at the base of the AH-2b, then a whip slides into the opening at the top of the holder and is secured by a couple of Allen screws. Shipping weight is less than a pound.

Hopefully, this will get my mobile installation up and running when that MKII comes back from Matt.

Nope, just reviewed my postings on this topic again, and no mention of which ICOM repair shop was involved.

However, in the past, I have highly recommended Matt Adrian's shop, SAR Technical Services, an authorized ICOM Service Center in St. Joseph, MI, and I still do so, especially in light of his superb handling of this situation.

Perhaps you recalled my prior recommendations. Another local ham had a "dead" IC-7000 which had problems that the ICOM Service Center in the SE basically gave up on. I suggested he send it to Matt (actually I had suggested he send it to Matt in the first place, but the guy didn't listen to me), and Matt got it up and running again in short order at a very reasonable repair charge.

It's all good!

# 18205. Bad xmit & recv audio on H.F. ssb

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-30 22:36:44 UTC
From: Jimmy
Topic: 18205  Message: 18205

After rig has been on awhile, my ssb audio on both xmit & rcv goes bad. On recieve it sounds like a nearby strong station is de-sentizing the reciever. It happens when the rig has been on for about 15 minutes so I thought that the problem was heat sensitive. The internal cooling fan comes on and I put an external muffin fan on the unit. The case cools down but the problem is still there. After turning the rig off for about 1/2 hour and turning it back on the audio is O.K. My next thought is that it is a voltage problem somewhere. Any suggestions?

Thanks

:-)

Well I can't advise on the EU model 706. I have no experience on the model nor have I ever looked at the schematic.

I will comment that in the USA models the diode to be removed is obvious once the unit has its cover removed. They are the ONLY diodes in the general location.

Suggestion: open the covers and take a look.

Subject: Re: [ic706] 706HF/VHF model

Do you have the 706, 706MKii or 706MKiiG/ MOD depends on model.

I did the DK.MODS for the 706 MKiiG four years ago and it worked fine.

If you do some "Google" searches on the internet for "706 modifications" and iterations of those terms, you'll find several sites which outline the mods required.

:-)

Well I can't advise on the EU model 706. I have no experience on the model nor have I ever looked at the schematic.

I will comment that in the USA models the diode to be removed is obvious once the unit has its cover removed. They are the ONLY diodes in the general location.

Suggestion: open the covers and take a look.

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

OVERALL IMPRESSION

"Too good to be true". This was my understandable reaction to Icom's announcement of the IC-706 amateur radio transceiver last summer. It looked like my dream mobile rig: very small size,detachable face plate, all HF bands, FSK, 6 meters with 100 watts... AND 2 meters, all in one rig? It sounds too good to be true, but after using this radio in my car for about a month, I can tell you that this radio is real. Although the rig is not without its faults, Icom has produced an innovative masterpiece. The rig does just about everything as advertised. It is an easy-to-use radio that replaces several other radios that I was operating in my car.

Over the Christmas holidays, I took a couple of long car trips here in Texas. The 706 was installed under a car seat, leaving plenty of room for luggage and packages. (Do NOT block the top of the rig. Leave room for air circulation. The rig gets VERY hot when transmitting!) The face plate was installed just below

the dash within easy sight when driving. I used headphones, so my wife and daughter could listen to CDs while I was working DX. The headphone plugged into the face plate. I used a 7-foot whip mounted on the trunk of the car tuned for the SSB portion of 6 meters, my favorite band. The radio was a pleasure to use, even while driving.

During a nice opening on 6 meters on the evening of December 27, I worked several new grid squares in the midwest and Arizona. I also worked North Dakota for the first time. I was able to work a station in Mexico City quite easily, despite the pileup. That 100 watts sure helps. (I previously used a 10-watt rig.) The sensitivity of the receiver, although not quite what the "pros" would want, was quite adequate. Noise from the car engine was only a minor problem; the noise blanker was effective for SSB.

During the trip I also listened to a football game on TV channel 2, listened to truckers' traffic reports on CB channel 19 (27.185 MHz), worked a couple of 10m stations during the sporadic E opening on December 27, worked a couple of 20m stations, listened to WWV on 2.5, 5, and 10 MHz, eavesdropped on some interesting baby monitors and cordless phones on 49 MHz, listened to NOAA weather forecasts on 162.55 MHz, monitored some aircraft traffic, and did some ragchewing on 2-meter repeaters. Not bad for ONE radio!

PRICE

I paid $1249 for mine at Tucker Electronics in Dallas. They told me that they have sold about 200 of them in six weeks, making the IC- 706 their best selling rig of all time. They are getting them from Icom in lots of 20 and are having trouble keeping them in stock.

Prices for accessories are pretty high. There is little profit margin in the box, so they make up for it with high accessory prices. The cable to allow for front-panel detachment is $48.

UNIQUE FEATURES AND INNOVATIONS

See http://www.icomamerica.com/icom/amateur/hf#ic-706

for a list of features.

* The smallest HF rig on the market (similar in size to the Kenwood TS-50)

* Detachable face plate with a jack for a speaker or headphone. The mic plugs into the face plate using a plug similar to a modular telephone plug. (A spare plug is included.) The cable to allow for this detachment costs extra.

* Full HF/VHF transmit coverage from 1.6 to 54 MHz and 144-148 MHz (the rig transmits only on the ham bands out of the box, but an easy modification unlocks the transmitter, see below)

* General coverage receive from 50 KHz to 163 MHz (requires modification, see below) Rig receives up to 200 MHz but with poor sensitivity above 162 MHz even with the modification. You will be able to receive: longwave, AM broadcast band, shortwave broadcast, all amateur bands in all modes from 160m to 2m, FM

broadcast band (wide FM), aircraft (118-136 MHz AM), VHF from 30 MHz to about 162 MHz, US TV channels 2 through 6, NOAA weather at 162 MHZ.

* 6 meters and 2 meters, all-mode

* 100 watts on HF and 6 meters (10 watts on 2 meters)

* Innovative, easy-to-operate menu system. It becomes quite easy and natural to use after reading the well-written manual for about an hour. (In contrast to my Yaesu FT-470 HT, which I still cannot figure out.)

* The manual is very well written, with lots of easy-to-understand diagrams.

* Simple, but useful and configurable band scope. (Previously available only on very expensive rigs like the Icom 781.) This allows you to examine nearby frequencies for activity.

* Split frequency operation appears complicated at first, but the rig's "quick split" mode makes it fast and easy.

* Built-in electronic keyer at no extra charge. The Up/Down buttons on the mic can be used as a paddle. This has rejuvenated by interest in CW. I worked a couple of slow CW stations on the novice portion of 80m, which made me remember how fun CW is.

* FSK (Nice feature for this price range)

* DTMF and programmable offset for repeaters and split frequency work

* Good audio reports from contacted stations. A station on 3.85 MHz reported "a very good signal for a mobile". A 2m FM station reported "very good audio ... so that's the 706 I've been hearing about."

* Works very well with the AH-3 antenna tuner. This is the Icom HF (1.8-30 MHz) random wire tuner that worked with the 725. The tuner is mounted under the trunk lid of my car with cable ties. It can also be mounted outdoors. It will tune any 8-foot whip or wire for any HF band. (You need 40 feet for it to tune to 160m.) You can press a button to enable the tuner, or the tuner can fire off automatically if your SWR is too high. With my 7-foot 6-meter whip, I can tune to any HF band above 3.5 MHz. That means I need only one simple antenna for HF and 6m.

* 100 memories that store frequency, split offset, mode, and FM tone.

* Two antenna connectors: one for HF/6m and one for 2m. The connectors are switched at 60 MHz.

* Jacks for remote speaker and/or headphones on both the face plate and the back of the rig.

* Multifunction meter: S meter, SWR, relative power output, ALC.

DRAWBACKS/FLAWS

* Extended VHF receive requires modification (see below).

* Poor sensitivity above 162 MHz.

* Noise blanker does not work on AM. Very irritating pulse noise on AM while the car's engine is on. The blanker works well on other modes (except FM, where it is not needed). Not good for listening to AM while driving. A rather serious flaw in my opinion, since my $40 CB has a noise blanker that works well.

* Poor QSK (full break-in) capability. Not recommended for high-speed CW operators who want QSK. Use semi-break-in instead.

* No CW narrow filter. You can install one as an extra-cost option or use an external CW filter or DSP unit.

* The built-in speaker provides surprisingly good audio for its size, but you will probably want to use an external speaker. The speaker can be connected to the face plate or to the rig itself.

* Automatic repeater offset is not programmed into the rig. You need to program -600 or +600 yourself through the menu system. This is not a problem if you store your favorite repeaters into one of the 100 memories.

* The S-meter is inaccurate below S9. Above S9, it is quite accurate.

* High prices for accessories (typical of just about all other vendors)

* The AH-3 antenna tuner is shipped with an unshielded cable, which picks up a lot of auto engine noise. You need to make your own shielded 4-wire cable. The AH-3 also blocks signals above 54 MHz. It also only works for HF, not for 6m or 2m.

* Expect performance and receiver sensitivity similar to other rigs in this price range. This is a low-end rig in terms of price. For price vs. performance, this is probably the best amateur radio of all time. However, it will not outperform your $4000 rig. You probably won't win contests with it. You will have a lot of fun and own a nearly ideal rig for mobile work.

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver
2) Tweezers
3) Magnifying glass
4) Low-wattage (15 watt) soldering iron
5) Long-nosed pliers

MODIFICATION 1:

Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band transmit. Your memories will be cleared after this modification, since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny diodes, two blank spaces, and one additional diode. They look something like this:

D108

[XX] [XX] [ ] [ ] [XX]

Remove this diode ^^^^

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a low-wattage soldering iron and pull it up with tweezers. Be sure not to damage the other diodes or the PCB. Be sure that you don't apply too much heat, since the heat can damage the PCB and the other diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2:

Enables more sensitive receive above the 2 meter band. (148 to about 162 MHz; after that, sensitivity drops off.) Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper clip in the side of the connector under the wire, push it in, and pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.

```
+------------------------+
| | *
[XX] [XX] [XX] [XX] [XX] +-O *** J8
*
Solder wire into this hole ^
```

8) Solder a small wire into this hole. Be careful not to pply too much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

ICOM-706 MODIFICATIONS
As of Dec. 9, 1995

SUMMARY
-------

MODIFICATION 1: Enables extended transmit from 1.6 to 54 MHz inclusive.
MODIFICATION 2: Enables extended receive from .05 to about 165 MHz inclusive.

CAUTION
-------

Improperly performed modifications can severely damage your radio.
Use extreme caution. Proceed at your own risk.

Transmitting on frequencies other than those assigned to the amateur
radio service may be illegal.

TOOLS RECOMMENDED
---

1) Small philips-head screwdriver
2) Magnifying glass
3) Small wattage (15 watt) soldering iron with a small tip
4) Long-nosed pliers
5) Paper clip
6) Tweezers

MODIFICATION 1
---

Result of modification: The IC-706 transmits only on the ham bands. This modification allows for transmit on any frequency from 1.6 to 54 MHz. The radio will also continue to transmit on 2 meters (144 to 148 MHz in the United States) at 10 watts output. This modification will NOT allow for transmit on the AM or FM broadcast bands. The radio will appear to transmit on most frequencies above 54 MHz, but the power output will be a milliwatt or less. The highest power output will be 100 watts from 1.6 to 54 MHz (SSB, FM, CW; 40 watts AM) and 10 watts on 2 meters. (SSB, FM, CW; 4 watts AM) Note: This modification requires that you reset the CPU. All memory information will be erased.

1) Disconnect the power cable. Open the TOP cover of the radio. You will need to remove only 5 screws: three on the top of the radio and one screw on each side. Pull up the speaker carefully and set it aside. Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly marked on the top of it. Now look to the right. Note the "D 108" marking. Below this marking, there are three tiny black diodes. There are two diodes, followed by two blank sockets, followed by another diode.

3) The second diode from the left (the middle diode) is diode D-59. This diode needs to be removed. There are many ways to remove this diode. The easiest way is to crush it with long-nosed pliers. Another way is to use a low-wattage soldering iron and tweezers and carefully heat the diode, then pull with the tweezers. Be extremely careful not to apply too much heat.

4) Re-assemble the radio. Press and hold the UP and DOWN buttons on the right side of the front panel, and while holding them down, turn on the power. This resets the CPU.

MODIFICATION 2
---

Result of modification: The bandpass filters on the IC-706 are improperly wired. As a result, the radio does not receive any

stations above 129 MHz, except in the 2-meter band. This modification
allows for reception up to about 165 MHz.

(Note: If your radio receives the FM broadcast band (88-108 MHz), the aircraft band
(108-136 MHz), 2 meters, and stations above 148 MHz, it is possible that the modification
has already been performed by Icom; you may have a later model.)

1) Open the TOP cover of the radio. You will need to remove only
5 screws: three on the back of the radio and one screw on each side.
Pull up the speaker carefully and set it aside. Look at the radio
from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly
marked on the top of it. Now move your eyes toward the back of the
radio until you notice a long white connector with several colored
wires on it.

3) The 4th wire from the left, a yellow wire, needs to be removed
from the connector. You can cut this wire carefully if you wish.
Or, another alternaive is to remove it from the connector. Stick a paper clip or
perhaps a pin into the side of the connector under the yellow wire.
Pull the wire with tweezers and remove it. There are two yellow wires;
be sure to remove the 4th wire from the left, not the other one.

4) Open the BOTTOM of the radio, removing similar screws as you did
when you removed the TOP.

5) Look at the PC board just behind the MENU button. You will notice
a jack marked "J8" with a grey cable coming out of it.

6) To the left of jack J8, you will see five tiny transistors.
Look at the middle transistor. Follow the light green circuit board
trace from the middle transistor to a tiny hole just to the left of J9.

7) The yellow wire from the top of the radio needs to be connected
to this transistor. The easiest way is to solder a small insulated
wire to the yellow wire you just removed, run this new wire underneath
the radio to the hole you found in #6 above, put the wire into the hole, and
solder the wire into the hole with a low-wattage soldering iron.
Use caution not to damage the grey cable or to apply too much heat.
This could damage the PCB and seriously affect the radio.

If you perform only steps 1 through 3, you will be able to hear stations
above 148 MHz, but you will not be able to hear FM broadcast stations
on the 88-108 MHz band.

RECEPTION SUGGESTIONS
---

1) You need to use wide FM to receive FM broadcast signals on the
88-108 MHz band, or TV sound signals between 59 and 87 MHz. To
receive wide FM, press the MODE button until "FM" or "FM-T" appears
on the display, then press and hold the MODE button for two seconds.

"WFM" should now appear on the display, and you should be able to hear the FM broadcast stations. Reception quality is quite good if you use a decent external speaker.

2) Aircraft (118-136 MHz) uses AM. You will need to set the radio to AM to receive aircraft.

3) The sensitivity of the radio diminishes rapidly after about 165 MHz. NOAA weather stations (162.40 to 162.55) are clearly audible, however.

4) If you find the FM broadcast signals overload the aircraft portion of the bands, disable the preampifier by pressing PREAMP (the green light should go out.)

ICOM-706 MODIFICATIONS
As of Dec. 9, 1995
```

SUMMARY
-------

MODIFICATION 1: Enables extended transmit from 1.6 to 54 MHz inclusive.
MODIFICATION 2: Enables extended receive from .05 to about 165 MHz inclusive.

CAUTION
-------

Improperly performed modifications can severely damage your radio.
Use extreme caution. Proceed at your own risk.

Transmitting on frequencies other than those assigned to the amateur
radio service may be illegal.

TOOLS RECOMMENDED
-----------------

1) Small philips-head screwdriver
2) Magnifying glass
3) Small wattage (15 watt) soldering iron with a small tip
4) Long-nosed pliers
5) Paper clip
6) Tweezers

MODIFICATION 1
--------------

Result of modification: The IC-706 transmits only on the ham bands.
This modification allows for transmit on any frequency from 1.6 to
54 MHz. The radio will also continue to transmit on 2 meters (144
to 148 MHz in the United States) at 10 watts output. This modification
will NOT allow for transmit on the AM or FM broadcast bands. The radio
will appear to transmit on most frequencies above 54 MHz, but the power
output will be a milliwatt or less. The highest power output will be
100 watts from 1.6 to 54 MHz (SSB, FM, CW; 40 watts AM) and 10 watts
on 2 meters. (SSB, FM, CW; 4 watts AM) Note: This modification
requires that you reset the CPU. All memory information will be
erased.

1) Disconnect the power cable. Open the TOP cover of the radio.
You will need to remove only 5 screws: three on the top of the
radio and one screw on each side. Pull up the speaker carefully and
set it aside. Look at the radio from the front; the speaker area
should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly
marked on the top of it. Now look to the right. Note the "D 108"
marking. Below this marking, there are three tiny black diodes.
There are two diodes, followed by two blank sockets, followed
by another diode.

3) The second diode from the left (the middle diode) is diode D-59.
This diode needs to be removed. There are many ways to remove this

diode. The easiest way is to crush it with long-nosed pliers. Another way is to use a low-wattage soldering iron and tweezers and carefully heat the diode, then pull with the tweezers. Be extremely careful not to apply too much heat.

4) Re-assemble the radio. Press and hold the UP and DOWN buttons on the right side of the front panel, and while holding them down, turn on the power. This resets the CPU.

MODIFICATION 2
---

Result of modification: The bandpass filters on the IC-706 are improperly wired. As a result, the radio does not receive any stations above 129 MHz, except in the 2-meter band. This modification allows for reception up to about 165 MHz.

(Note: If your radio receives the FM broadcast band (88-108 MHz), the aircraft band (108-136 MHz), 2 meters, and stations above 148 MHz, it is possible that the modification has already been performed by Icom; you may have a later model.)

1) Open the TOP cover of the radio. You will need to remove only 5 screws: three on the back of the radio and one screw on each side. Pull up the speaker carefully and set it aside. Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly marked on the top of it. Now move your eyes toward the back of the radio until you notice a long white connector with several colored wires on it.

3) The 4th wire from the left, a yellow wire, needs to be removed from the connector. You can cut this wire carefully if you wish. Or, another alternaive is to remove it from the connector. Stick a paper clip or perhaps a pin into the side of the connector under the yellow wire. Pull the wire with tweezers and remove it. There are two yellow wires; be sure to remove the 4th wire from the left, not the other one.

4) Open the BOTTOM of the radio, removing similar screws as you did when you removed the TOP.

5) Look at the PC board just behind the MENU button. You will notice a jack marked "J8" with a grey cable coming out of it.

6) To the left of jack J8, you will see five tiny transistors. Look at the middle transistor. Follow the light green circuit board trace from the middle transistor to a tiny hole just to the left of J9.

7) The yellow wire from the top of the radio needs to be connected to this transistor. The easiest way is to solder a small insulated wire to the yellow wire you just removed, run this new wire underneath the radio to the hole you found in #6 above, put the wire into the hole, and solder the wire into the hole with a low-wattage soldering iron.

Use caution not to damage the grey cable or to apply too much heat.
This could damage the PCB and seriously affect the radio.

If you perform only steps 1 through 3, you will be able to hear stations
above 148 MHz, but you will not be able to hear FM broadcast stations
on the 88-108 MHz band.

RECEPTION SUGGESTIONS
---

1) You need to use wide FM to receive FM broadcast signals on the
88-108 MHz band, or TV sound signals between 59 and 87 MHz. To
receive wide FM, press the MODE button until "FM" or "FM-T" appears
on the display, then press and hold the MODE button for two seconds.
"WFM" should now appear on the display, and you should be able to
hear the FM broadcast stations. Reception quality is quite good
if you use a decent external speaker.

2) Aircraft (118-136 MHz) uses AM. You will need to set the radio
to AM to receive aircraft.

3) The sensitivity of the radio diminishes rapidly after about 165 MHz.
NOAA weather stations (162.40 to 162.55) are clearly audible, however.

4) If you find the FM broadcast signals overload the aircraft portion
of the bands, disable the preampifier by pressing PREAMP (the green
light should go out.)

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

OVERALL IMPRESSION

"Too good to be true". This was my understandable reaction to Icom's
announcement of the IC-706 amateur radio transceiver last summer. It looked like
my dream mobile rig: very small size,detachable face plate, all HF bands, FSK,
6 meters with 100 watts... AND 2 meters, all in one rig? It sounds too good to
be true, but after using this radio in my car for about a month, I can tell you
that this radio is real. Although the rig is not without its faults, Icom has
produced an innovative masterpiece. The rig does just about everything as
advertised. It is an easy-to-use radio that replaces several other radios that
I was operating in my car.

Over the Christmas holidays, I took a couple of long car trips here in Texas.
The 706 was installed under a car seat, leaving plenty of room for luggage and
packages. (Do NOT block the top of the rig. Leave room for air circulation. The
rig gets VERY hot when transmitting!) The face plate was installed just below

the dash within easy sight when driving. I used headphones, so my wife and daughter could listen to CDs while I was working DX. The headphone plugged into the face plate. I used a 7-foot whip mounted on the trunk of the car tuned for the SSB portion of 6 meters, my favorite band. The radio was a pleasure to use, even while driving.

During a nice opening on 6 meters on the evening of December 27, I worked several new grid squares in the midwest and Arizona. I also worked North Dakota for the first time. I was able to work a station in Mexico City quite easily, despite the pileup. That 100 watts sure helps. (I previously used a 10-watt rig.) The sensitivity of the receiver, although not quite what the "pros" would want, was quite adequate. Noise from the car engine was only a minor problem; the noise blanker was effective for SSB.

During the trip I also listened to a football game on TV channel 2, listened to truckers' traffic reports on CB channel 19 (27.185 MHz), worked a couple of 10m stations during the sporadic E opening on December 27, worked a couple of 20m stations, listened to WWV on 2.5, 5, and 10 MHz, eavesdropped on some interesting baby monitors and cordless phones on 49 MHz, listened to NOAA weather forecasts on 162.55 MHz, monitored some aircraft traffic, and did some ragchewing on 2-meter repeaters. Not bad for ONE radio!

PRICE

I paid $1249 for mine at Tucker Electronics in Dallas. They told me that they have sold about 200 of them in six weeks, making the IC- 706 their best selling rig of all time. They are getting them from Icom in lots of 20 and are having trouble keeping them in stock.

Prices for accessories are pretty high. There is little profit margin in the box, so they make up for it with high accessory prices. The cable to allow for front-panel detachment is $48.

UNIQUE FEATURES AND INNOVATIONS

See http://www.icomamerica.com/icom/amateur/hf#ic-706

for a list of features.

* The smallest HF rig on the market (similar in size to the Kenwood TS-50)

* Detachable face plate with a jack for a speaker or headphone. The mic plugs into the face plate using a plug similar to a modular telephone plug. (A spare plug is included.) The cable to allow for this detachment costs extra.

* Full HF/VHF transmit coverage from 1.6 to 54 MHz and 144-148 MHz (the rig transmits only on the ham bands out of the box, but an easy modification unlocks the transmitter, see below)

* General coverage receive from 50 KHz to 163 MHz (requires modification, see below) Rig receives up to 200 MHz but with poor sensitivity above 162 MHz even with the modification. You will be able to receive: longwave, AM broadcast band, shortwave broadcast, all amateur bands in all modes from 160m to 2m, FM

broadcast band (wide FM), aircraft (118-136 MHz AM), VHF from 30 MHz to about 162 MHz, US TV channels 2 through 6, NOAA weather at 162 MHZ.

* 6 meters and 2 meters, all-mode

* 100 watts on HF and 6 meters (10 watts on 2 meters)

* Innovative, easy-to-operate menu system. It becomes quite easy and natural to use after reading the well-written manual for about an hour. (In contrast to my Yaesu FT-470 HT, which I still cannot figure out.)

* The manual is very well written, with lots of easy-to-understand diagrams.

* Simple, but useful and configurable band scope. (Previously available only on very expensive rigs like the Icom 781.) This allows you to examine nearby frequencies for activity.

* Split frequency operation appears complicated at first, but the rig's "quick split" mode makes it fast and easy.

* Built-in electronic keyer at no extra charge. The Up/Down buttons on the mic can be used as a paddle. This has rejuvenated by interest in CW. I worked a couple of slow CW stations on the novice portion of 80m, which made me remember how fun CW is.

* FSK (Nice feature for this price range)

* DTMF and programmable offset for repeaters and split frequency work

* Good audio reports from contacted stations. A station on 3.85 MHz reported "a very good signal for a mobile". A 2m FM station reported "very good audio ... so that's the 706 I've been hearing about."

* Works very well with the AH-3 antenna tuner. This is the Icom HF (1.8-30 MHz) random wire tuner that worked with the 725. The tuner is mounted under the trunk lid of my car with cable ties. It can also be mounted outdoors. It will tune any 8-foot whip or wire for any HF band. (You need 40 feet for it to tune to 160m.) You can press a button to enable the tuner, or the tuner can fire off automatically if your SWR is too high. With my 7-foot 6-meter whip, I can tune to any HF band above 3.5 MHz. That means I need only one simple antenna for HF and 6m.

* 100 memories that store frequency, split offset, mode, and FM tone.

* Two antenna connectors: one for HF/6m and one for 2m. The connectors are switched at 60 MHz.

* Jacks for remote speaker and/or headphones on both the face plate and the back of the rig.

* Multifunction meter: S meter, SWR, relative power output, ALC.

DRAWBACKS/FLAWS

* Extended VHF receive requires modification (see below).

* Poor sensitivity above 162 MHz.

* Noise blanker does not work on AM. Very irritating pulse noise on AM while the car's engine is on. The blanker works well on other modes (except FM, where it is not needed). Not good for listening to AM while driving. A rather serious flaw in my opinion, since my $40 CB has a noise blanker that works well.

* Poor QSK (full break-in) capability. Not recommended for high-speed CW operators who want QSK. Use semi-break-in instead.

* No CW narrow filter. You can install one as an extra-cost option or use an external CW filter or DSP unit.

* The built-in speaker provides surprisingly good audio for its size, but you will probably want to use an external speaker. The speaker can be connected to the face plate or to the rig itself.

* Automatic repeater offset is not programmed into the rig. You need to program -600 or +600 yourself through the menu system. This is not a problem if you store your favorite repeaters into one of the 100 memories.

* The S-meter is inaccurate below S9. Above S9, it is quite accurate.

* High prices for accessories (typical of just about all other vendors)

* The AH-3 antenna tuner is shipped with an unshielded cable, which picks up a lot of auto engine noise. You need to make your own shielded 4-wire cable. The AH-3 also blocks signals above 54 MHz. It also only works for HF, not for 6m or 2m.

* Expect performance and receiver sensitivity similar to other rigs in this price range. This is a low-end rig in terms of price. For price vs. performance, this is probably the best amateur radio of all time. However, it will not outperform your $4000 rig. You probably won't win contests with it. You will have a lot of fun and own a nearly ideal rig for mobile work.

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver
2) Tweezers
3) Magnifying glass
4) Low-wattage (15 watt) soldering iron
5) Long-nosed pliers

MODIFICATION 1:

Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band transmit. Your memories will be cleared after this modification, since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny diodes, two blank spaces, and one additional diode. They look something like this:

D108

[XX] [XX] [ ] [ ] [XX]

Remove this diode ^^^^

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a low-wattage soldering iron and pull it up with tweezers. Be sure not to damage the other diodes or the PCB. Be sure that you don't apply too much heat, since the heat can damage the PCB and the other diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2:

Enables more sensitive receive above the 2 meter band. (148 to about 162 MHz; after that, sensitivity drops off.) Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper clip in the side of the connector under the wire, push it in, and pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.

```
+------------------------+
| | *
[XX] [XX] [XX] [XX] [XX] +-O *** J8
*
Solder wire into this hole ^
```

8) Solder a small wire into this hole. Be careful not to pply too much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

ICOM-706 MODIFICATIONS
As of Dec. 9, 1995

SUMMARY
-------

MODIFICATION 1: Enables extended transmit from 1.6 to 54 MHz inclusive.
MODIFICATION 2: Enables extended receive from .05 to about 165 MHz inclusive.

CAUTION
-------

Improperly performed modifications can severely damage your radio.
Use extreme caution.  Proceed at your own risk.

Transmitting on frequencies other than those assigned to the amateur
radio service may be illegal.

TOOLS RECOMMENDED
-----------------

1) Small philips-head screwdriver
2) Magnifying glass
3) Small wattage (15 watt) soldering iron with a small tip
4) Long-nosed pliers
5) Paper clip
6) Tweezers

MODIFICATION 1
--------------

Result of modification:  The IC-706 transmits only on the ham bands.
This modification allows for transmit on any frequency from 1.6 to
54 MHz.  The radio will also continue to transmit on 2 meters (144
to 148 MHz in the United States) at 10 watts output.  This modification
will NOT allow for transmit on the AM or FM broadcast bands.  The radio
will appear to transmit on most frequencies above 54 MHz, but the power
output will be a milliwatt or less.  The highest power output will be
100 watts from 1.6 to 54 MHz (SSB, FM, CW; 40 watts AM) and 10 watts
on 2 meters. (SSB, FM, CW; 4 watts AM)  Note: This modification
requires that you reset the CPU.  All memory information will be
erased.

1) Disconnect the power cable.  Open the TOP cover of the radio.
You will need to remove only 5 screws: three on the top of the

radio and one screw on each side.  Pull up the speaker carefully and set it aside.  Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter.  This is clearly marked on the top of it.  Now look to the right.  Note the "D 108" marking.  Below this marking, there are three tiny black diodes. There are two diodes, followed by two blank sockets, followed by another diode.

3) The second diode from the left (the middle diode) is diode D-59. This diode needs to be removed.  There are many ways to remove this diode.  The easiest way is to crush it with long-nosed pliers.  Another way is to use a low-wattage soldering iron and tweezers and carefully heat the diode, then pull with the tweezers.  Be extremely careful not to apply too much heat.

4) Re-assemble the radio.  Press and hold the UP and DOWN buttons on the right side of the front panel, and while holding them down, turn on the power.  This resets the CPU.

MODIFICATION 2
---

Result of modification:  The bandpass filters on the IC-706 are improperly wired.  As a result, the radio does not receive any stations above 129 MHz, except in the 2-meter band.  This modification allows for reception up to about 165 MHz.

(Note: If your radio receives the FM broadcast band (88-108 MHz), the aircraft band

(108-136 MHz), 2 meters, and stations above 148 MHz, it is possible that the modification

has already been performed by Icom; you may have a later model.)

1) Open the TOP cover of the radio.  You will need to remove only 5 screws: three on the back of the radio and one screw on each side. Pull up the speaker carefully and set it aside.  Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter.  This is clearly marked on the top of it.  Now move your eyes toward the back of the radio until you notice a long white connector with several colored wires on it.

3) The 4th wire from the left, a yellow wire, needs to be removed from the connector.  You can cut this wire carefully if you wish. Or, another alternaive is to remove it from the connector.  Stick a paper clip or
perhaps a pin into the side of the connector under the yellow wire. Pull the wire with tweezers and remove it.  There are two yellow wires;

be sure to remove the 4th wire from the left, not the other one.

4) Open the BOTTOM of the radio, removing similar screws as you did
when you removed the TOP.

5) Look at the PC board just behind the MENU button.  You will notice
a jack marked "J8" with a grey cable coming out of it.

6) To the left of jack J8, you will see five tiny transistors.
Look at the middle transistor.  Follow the light green circuit board
trace from the middle transistor to a tiny hole just to the left of J9.

7) The yellow wire from the top of the radio needs to be connected
to this transistor.  The easiest way is to solder a small insulated
wire to the yellow wire you just removed, run this new wire underneath
the radio to the hole you found in #6 above, put the wire into the hole, and
solder the wire into the hole with a low-wattage soldering iron.
Use caution not to damage the grey cable or to apply too much heat.
This could damage the PCB and seriously affect the radio.

If you perform only steps 1 through 3, you will be able to hear stations
above 148 MHz, but you will not be able to hear FM broadcast stations
on the 88-108 MHz band.

RECEPTION SUGGESTIONS
---

1) You need to use wide FM to receive FM broadcast signals on the
88-108 MHz band, or TV sound signals between 59 and 87 MHz.  To
receive wide FM, press the MODE button until "FM" or "FM-T" appears
on the display, then press and hold the MODE button for two seconds.
"WFM" should now appear on the display, and you should be able to
hear the FM broadcast stations.  Reception quality is quite good
if you use a decent external speaker.

2) Aircraft (118-136 MHz) uses AM.  You will need to set the radio
to AM to receive aircraft.

3) The sensitivity of the radio diminishes rapidly after about 165 MHz.
NOAA weather stations (162.40 to 162.55) are clearly audible, however.

4) If you find the FM broadcast signals overload the aircraft portion
of the bands, disable the preampifier by pressing PREAMP (the green
light should go out.)

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

OVERALL IMPRESSION

"Too good to be true". This was my understandable reaction to Icom's announcement of the IC-706 amateur radio transceiver last summer. It looked like my dream mobile rig: very small size,detachable face plate, all HF bands, FSK, 6 meters with 100 watts... AND 2 meters, all in one rig? It sounds too good to be true, but after using this radio in my car for about a month, I can tell you that this radio is real. Although the rig is not without its faults, Icom has produced an innovative masterpiece. The rig does just about everything as advertised. It is an easy-to-use radio that replaces several other radios that I was operating in my car.

Over the Christmas holidays, I took a couple of long car trips here in Texas. The 706 was installed under a car seat, leaving plenty of room for luggage and packages. (Do NOT block the top of the rig. Leave room for air circulation. The rig gets VERY hot when transmitting!) The face plate was installed just below the dash within easy sight when driving. I used headphones, so my wife and daughter could listen to CDs while I was working DX. The headphone plugged into the face plate. I used a 7-foot whip mounted on the trunk of the car tuned for the SSB portion of 6 meters, my favorite band. The radio was a pleasure to use, even while driving.

During a nice opening on 6 meters on the evening of December 27, I worked several new grid squares in the midwest and Arizona. I also worked North Dakota for the first time. I was able to work a station in Mexico City quite easily, despite the pileup. That 100 watts sure helps. (I previously used a 10-watt rig.) The sensitivity of the receiver, although not quite what the "pros" would want, was quite adequate. Noise from the car engine was only a minor problem; the noise blanker was effective for SSB.

During the trip I also listened to a football game on TV channel 2, listened to truckers' traffic reports on CB channel 19 (27.185 MHz), worked a couple of 10m stations during the sporadic E opening on December 27, worked a couple of 20m stations, listened to WWV on 2.5, 5, and 10 MHz, eavesdropped on some interesting baby monitors and cordless phones on 49 MHz, listened to NOAA weather forecasts on 162.55 MHz, monitored some aircraft traffic, and did some ragchewing on 2-meter repeaters. Not bad for ONE radio!

PRICE

I paid $1249 for mine at Tucker Electronics in Dallas. They told me that they have sold about 200 of them in six weeks, making the IC- 706 their best selling rig of all time. They are getting them from Icom in lots of 20 and are having trouble keeping them in stock.

Prices for accessories are pretty high. There is little profit margin in the box, so they make up for it with high accessory prices. The cable to allow for front-panel detachment is $48.

UNIQUE FEATURES AND INNOVATIONS

See http://www.icomamerica.com/icom/amateur/hf#ic-706

for a list of features.

* The smallest HF rig on the market (similar in size to the Kenwood TS-50)

* Detachable face plate with a jack for a speaker or headphone. The mic plugs into the face plate using a plug similar to a modular telephone plug. (A spare plug is included.) The cable to allow for this detachment costs extra.

* Full HF/VHF transmit coverage from 1.6 to 54 MHz and 144-148 MHz (the rig transmits only on the ham bands out of the box, but an easy modification unlocks the transmitter, see below)

* General coverage receive from 50 KHz to 163 MHz (requires modification, see below) Rig receives up to 200 MHz but with poor sensitivity above 162 MHz even with the modification. You will be able to receive: longwave, AM broadcast band, shortwave broadcast, all amateur bands in all modes from 160m to 2m, FM broadcast band (wide FM), aircraft (118-136 MHz AM), VHF from 30 MHz to about 162 MHz, US TV channels 2 through 6, NOAA weather at 162 MHZ.

* 6 meters and 2 meters, all-mode

* 100 watts on HF and 6 meters (10 watts on 2 meters)

* Innovative, easy-to-operate menu system. It becomes quite easy and natural to use after reading the well-written manual for about an hour. (In contrast to my Yaesu FT-470 HT, which I still cannot figure out.)

* The manual is very well written, with lots of easy-to-understand diagrams.

* Simple, but useful and configurable band scope. (Previously available only on very expensive rigs like the Icom 781.) This allows you to examine nearby frequencies for activity.

* Split frequency operation appears complicated at first, but the rig's "quick split" mode makes it fast and easy.

* Built-in electronic keyer at no extra charge. The Up/Down buttons on the mic can be used as a paddle. This has rejuvenated by interest in CW. I worked a couple of slow CW stations on the novice portion of 80m, which made me remember how fun CW is.

* FSK (Nice feature for this price range)

* DTMF and programmable offset for repeaters and split frequency work

* Good audio reports from contacted stations. A station on 3.85 MHz reported "a very good signal for a mobile". A 2m FM station reported "very good audio ... so that's the 706 I've been hearing about."

* Works very well with the AH-3 antenna tuner. This is the Icom HF (1.8-30 MHz) random wire tuner that worked with the 725. The tuner is mounted under the trunk lid of my car with cable ties. It can also be mounted outdoors. It will tune any 8-foot whip or wire for any HF band. (You need 40 feet for it to tune to 160m.) You can press a button to enable the tuner, or the tuner can fire off automatically if your SWR is too high. With my 7-foot 6-meter whip, I can tune to any HF band above 3.5 MHz. That means I need only one simple antenna for HF and 6m.

* 100 memories that store frequency, split offset, mode, and FM tone.

* Two antenna connectors: one for HF/6m and one for 2m. The connectors are switched at 60 MHz.

* Jacks for remote speaker and/or headphones on both the face plate and the back of the rig.

* Multifunction meter: S meter, SWR, relative power output, ALC.

DRAWBACKS/FLAWS

* Extended VHF receive requires modification (see below).

* Poor sensitivity above 162 MHz.

* Noise blanker does not work on AM. Very irritating pulse noise on AM while the car's engine is on. The blanker works well on other modes (except FM, where it is not needed). Not good for listening to AM while driving. A rather serious flaw in my opinion, since my $40 CB has a noise blanker that works well.

* Poor QSK (full break-in) capability. Not recommended for high-speed CW operators who want QSK. Use semi-break-in instead.

* No CW narrow filter. You can install one as an extra-cost option or use an external CW filter or DSP unit.

* The built-in speaker provides surprisingly good audio for its size, but you will probably want to use an external speaker. The speaker can be connected to the face plate or to the rig itself.

* Automatic repeater offset is not programmed into the rig. You need to program -600 or +600 yourself through the menu system. This is not a problem if you store your favorite repeaters into one of the 100 memories.

* The S-meter is inaccurate below S9. Above S9, it is quite accurate.

* High prices for accessories (typical of just about all other vendors)

* The AH-3 antenna tuner is shipped with an unshielded cable, which picks up a lot of auto engine noise. You need to make your own shielded 4-wire cable. The AH-3 also blocks signals above 54 MHz. It also only works for HF, not for 6m or 2m.

* Expect performance and receiver sensitivity similar to other rigs in this price range. This is a low-end rig in terms of price. For price vs. performance, this is probably the best amateur radio of all time. However, it will not outperform your $4000 rig. You probably won't win contests with it. You will have a lot of fun and own a nearly ideal rig for mobile work.

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver
2) Tweezers
3) Magnifying glass
4) Low-wattage (15 watt) soldering iron
5) Long-nosed pliers

MODIFICATION 1:

Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band  transmit. Your memories will be cleared after this modification, since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny  diodes, two blank spaces, and one additional diode. They look something like this:

```
                  D108

               [XX] [XX] [ ] [ ] [XX]

  Remove this diode ^^^^
```

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a  low-wattage soldering

iron and pull it up with tweezers. Be sure  not to damage the other diodes or the PCB. Be sure that you don't  apply too much heat, since the heat can damage the PCB and the other  diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2:

Enables more sensitive receive above the 2 meter  band. (148 to about 162 MHz; after that, sensitivity drops off.)  Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

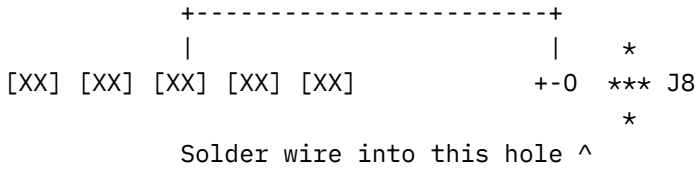
3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper  clip in the side of the connector under the wire, push it in, and  pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.



8) Solder a small wire into this hole. Be careful not to pply too  much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying  glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

# 18213. Re: [ic706] 706HF/VHF MODIFICATION

Yahoo group: ic706 (2010 — 2015)
Date: 2010-08-31 23:47:38 UTC
From: Joe Isabella
Topic: 18211  Message: 18213

Where are you trying to transmit? Mine works up to 60 MHz just fine. In VHF, it doesn't work. No known mod for that, that I'm aware of. I read a really long, involved mod that supposedly makes it work out of band on VHF, but I have no need for it.

There is also an alternate mod for opening up the receive in VHF. It involves moving a couple SMT coils/caps instead of the "yellow wire mod". It definitely works very well. I haven't compared the two, but before the mod, it was deaf trying to listen to NOAA on 162 MHz, and now it's quite good.

Joe, N3JI

ICOM-706 MODIFICATIONS
As of Dec. 9, 1995

SUMMARY
-------

MODIFICATION 1: Enables extended transmit from 1.6 to 54 MHz inclusive.
MODIFICATION 2: Enables extended receive from .05 to about 165 MHz inclusive.

CAUTION
-------

Improperly performed modifications can severely damage your radio.
Use extreme caution. Proceed at your own risk.

Transmitting on frequencies other than those assigned to the amateur
radio service may be illegal.

TOOLS RECOMMENDED
-----------------

1) Small philips-head screwdriver
2) Magnifying glass
3) Small wattage (15 watt) soldering iron with a small tip
4) Long-nosed pliers
5) Paper clip
6) Tweezers

MODIFICATION 1
---

Result of modification: The IC-706 transmits only on the ham bands. This modification allows for transmit on any frequency from 1.6 to 54 MHz. The radio will also continue to transmit on 2 meters (144 to 148 MHz in the United States) at 10 watts output. This modification will NOT allow for transmit on the AM or FM broadcast bands. The radio will appear to transmit on most frequencies above 54 MHz, but the power output will be a milliwatt or less. The highest power output will be 100 watts from 1.6 to 54 MHz (SSB, FM, CW; 40 watts AM) and 10 watts on 2 meters. (SSB, FM, CW; 4 watts AM) Note: This modification requires that you reset the CPU. All memory information will be erased.

1) Disconnect the power cable. Open the TOP cover of the radio. You will need to remove only 5 screws: three on the top of the radio and one screw on each side. Pull up the speaker carefully and set it aside. Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly marked on the top of it. Now look to the right. Note the "D 108" marking. Below this marking, there are three tiny black diodes. There are two diodes, followed by two blank sockets, followed by another diode.

3) The second diode from the left (the middle diode) is diode D-59. This diode needs to be removed. There are many ways to remove this diode. The easiest way is to crush it with long-nosed pliers. Another way is to use a low-wattage soldering iron and tweezers and carefully heat the diode, then pull with the tweezers. Be extremely careful not to apply too much heat.

4) Re-assemble the radio. Press and hold the UP and DOWN buttons on the right side of the front panel, and while holding them down, turn on the power. This resets the CPU.

MODIFICATION 2
---

Result of modification: The bandpass filters on the IC-706 are improperly wired. As a result, the radio does not receive any stations above 129 MHz, except in the 2-meter band. This modification allows for reception up to about 165 MHz.

(Note: If your radio receives the FM broadcast band (88-108 MHz), the aircraft band

(108-136 MHz), 2 meters, and stations above 148 MHz, it is possible that the modification

has already been performed by Icom; you may have a later model.)

1) Open the TOP cover of the radio. You will need to remove only
5 screws: three on the back of the radio and one screw on each side.
Pull up the speaker carefully and set it aside. Look at the radio
from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly
marked on the top of it. Now move your eyes toward the back of the
radio until you notice a long white connector with several colored
wires on it.

3) The 4th wire from the left, a yellow wire, needs to be removed
from the connector. You can cut this wire carefully if you wish.
Or, another alternaive is to remove it from the connector. Stick a paper clip
or
perhaps a pin into the side of the connector under the yellow wire.
Pull the wire with tweezers and remove it. There are two yellow wires;
be sure to remove the 4th wire from the left, not the other one.

4) Open the BOTTOM of the radio, removing similar screws as you did
when you removed the TOP.

5) Look at the PC board just behind the MENU button. You will notice
a jack marked "J8" with a grey cable coming out of it.

6) To the left of jack J8, you will see five tiny transistors.
Look at the middle transistor. Follow the light green circuit board
trace from the middle transistor to a tiny hole just to the left of J9.

7) The yellow wire from the top of the radio needs to be connected
to this transistor. The easiest way is to solder a small insulated
wire to the yellow wire you just removed, run this new wire underneath
the radio to the hole you found in #6 above, put the wire into the hole, and
solder the wire into the hole with a low-wattage soldering iron.
Use caution not to damage the grey cable or to apply too much heat.
This could damage the PCB and seriously affect the radio.

If you perform only steps 1 through 3, you will be able to hear stations
above 148 MHz, but you will not be able to hear FM broadcast stations
on the 88-108 MHz band.

RECEPTION SUGGESTIONS
---

1) You need to use wide FM to receive FM broadcast signals on the
88-108 MHz band, or TV sound signals between 59 and 87 MHz. To
receive wide FM, press the MODE button until "FM" or "FM-T" appears
on the display, then press and hold the MODE button for two seconds.
"WFM" should now appear on the display, and you should be able to
hear the FM broadcast stations. Reception quality is quite good
if you use a decent external speaker.

2) Aircraft (118-136 MHz) uses AM. You will need to set the radio
to AM to receive aircraft.

3) The sensitivity of the radio diminishes rapidly after about 165 MHz.
NOAA weather stations (162.40 to 162.55) are clearly audible, however.

4) If you find the FM broadcast signals overload the aircraft portion
of the bands, disable the preampifier by pressing PREAMP (the green
light should go out.)

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

OVERALL IMPRESSION

"Too good to be true". This was my understandable reaction to Icom's
announcement of the IC-706 amateur radio transceiver last summer. It looked like
my dream mobile rig: very small size,detachable face plate, all HF bands, FSK,
6 meters with 100 watts... AND 2 meters, all in one rig? It sounds too good to
be true, but after using this radio in my car for about a month, I can tell you
that this radio is real. Although the rig is not without its faults, Icom has
produced an innovative masterpiece. The rig does just about everything as
advertised. It is an easy-to-use radio that replaces several other radios that
I was operating in my car.

Over the Christmas holidays, I took a couple of long car trips here in Texas.
The 706 was installed under a car seat, leaving plenty of room for luggage and
packages. (Do NOT block the top of the rig. Leave room for air circulation. The
rig gets VERY hot when transmitting!) The face plate was installed just below
the dash within easy sight when driving. I used headphones, so my wife and
daughter could listen to CDs while I was working DX. The headphone plugged into
the face plate. I used a 7-foot whip mounted on the trunk of the car tuned for
the SSB portion of 6 meters, my favorite band. The radio was a pleasure to use,
even while driving.

During a nice opening on 6 meters on the evening of December 27, I worked
several new grid squares in the midwest and Arizona. I also worked North Dakota
for the first time. I was able to work a station in Mexico City quite easily,
despite the pileup. That 100 watts sure helps. (I previously used a 10-watt
rig.) The sensitivity of the receiver, although not quite what the "pros"
would want, was quite adequate. Noise from the car engine was only a minor
problem; the noise blanker was effective for SSB.

During the trip I also listened to a football game on TV channel 2, listened
to truckers' traffic reports on CB channel 19 (27.185 MHz), worked a couple of
10m stations during the sporadic E opening on December 27, worked a couple of
20m stations, listened to WWV on 2.5, 5, and 10 MHz, eavesdropped on some
interesting baby monitors and cordless phones on 49 MHz, listened to NOAA
weather forecasts on 162.55 MHz, monitored some aircraft traffic, and did some
ragchewing on 2-meter repeaters. Not bad for ONE radio!

PRICE

I paid $1249 for mine at Tucker Electronics in Dallas. They told me that they have sold about 200 of them in six weeks, making the IC- 706 their best selling rig of all time. They are getting them from Icom in lots of 20 and are having trouble keeping them in stock.

Prices for accessories are pretty high. There is little profit margin in the box, so they make up for it with high accessory prices. The cable to allow for front-panel detachment is $48.

UNIQUE FEATURES AND INNOVATIONS

See http://www.icomamerica.com/icom/amateur/hf#ic-706

for a list of features.

* The smallest HF rig on the market (similar in size to the Kenwood TS-50)

* Detachable face plate with a jack for a speaker or headphone. The mic plugs into the face plate using a plug similar to a modular telephone plug. (A spare plug is included.) The cable to allow for this detachment costs extra.

* Full HF/VHF transmit coverage from 1.6 to 54 MHz and 144-148 MHz (the rig transmits only on the ham bands out of the box, but an easy modification unlocks the transmitter, see below)

* General coverage receive from 50 KHz to 163 MHz (requires modification, see below) Rig receives up to 200 MHz but with poor sensitivity above 162 MHz even with the modification. You will be able to receive: longwave, AM broadcast band, shortwave broadcast, all amateur bands in all modes from 160m to 2m, FM broadcast band (wide FM), aircraft (118-136 MHz AM), VHF from 30 MHz to about 162 MHz, US TV channels 2 through 6, NOAA weather at 162 MHZ.

* 6 meters and 2 meters, all-mode

* 100 watts on HF and 6 meters (10 watts on 2 meters)

* Innovative, easy-to-operate menu system. It becomes quite easy and natural to use after reading the well-written manual for about an hour. (In contrast to my Yaesu FT-470 HT, which I still cannot figure out.)

* The manual is very well written, with lots of easy-to-understand diagrams.

* Simple, but useful and configurable band scope. (Previously available only on very expensive rigs like the Icom 781.) This allows you to examine nearby frequencies for activity.

* Split frequency operation appears complicated at first, but the rig's "quick split" mode makes it fast and easy.

* Built-in electronic keyer at no extra charge. The Up/Down buttons on the mic can be used as a paddle. This has rejuvenated by interest in CW. I worked a couple of slow CW stations on the novice portion of 80m, which made me remember how fun CW is.

* FSK (Nice feature for this price range)

* DTMF and programmable offset for repeaters and split frequency work

* Good audio reports from contacted stations. A station on 3.85 MHz reported "a very good signal for a mobile". A 2m FM station reported "very good audio ... so that's the 706 I've been hearing about."

* Works very well with the AH-3 antenna tuner. This is the Icom HF (1.8-30 MHz) random wire tuner that worked with the 725. The tuner is mounted under the trunk lid of my car with cable ties. It can also be mounted outdoors. It will tune any 8-foot whip or wire for any HF band. (You need 40 feet for it to tune to 160m.) You can press a button to enable the tuner, or the tuner can fire off automatically if your SWR is too high. With my 7-foot 6-meter whip, I can tune to any HF band above 3.5 MHz. That means I need only one simple antenna for HF and 6m.

* 100 memories that store frequency, split offset, mode, and FM tone.

* Two antenna connectors: one for HF/6m and one for 2m. The connectors are switched at 60 MHz.

* Jacks for remote speaker and/or headphones on both the face plate and the back of the rig.

* Multifunction meter: S meter, SWR, relative power output, ALC.

DRAWBACKS/FLAWS

* Extended VHF receive requires modification (see below).

* Poor sensitivity above 162 MHz.

* Noise blanker does not work on AM. Very irritating pulse noise on AM while the car's engine is on. The blanker works well on other modes (except FM, where it is not needed). Not good for listening to AM while driving. A rather serious flaw in my opinion, since my $40 CB has a noise blanker that works well.

* Poor QSK (full break-in) capability. Not recommended for high-speed CW operators who want QSK. Use semi-break-in instead.

* No CW narrow filter. You can install one as an extra-cost option or use an external CW filter or DSP unit.

* The built-in speaker provides surprisingly good audio for its size, but you will probably want to use an external speaker. The speaker can be connected to the face plate or to the rig itself.

* Automatic repeater offset is not programmed into the rig. You need to program -600 or +600 yourself through the menu system. This is not a problem if you store your favorite repeaters into one of the 100 memories.

* The S-meter is inaccurate below S9. Above S9, it is quite accurate.

* High prices for accessories (typical of just about all other vendors)

* The AH-3 antenna tuner is shipped with an unshielded cable, which picks up a lot of auto engine noise. You need to make your own shielded 4-wire cable. The AH-3 also blocks signals above 54 MHz. It also only works for HF, not for 6m or 2m.

* Expect performance and receiver sensitivity similar to other rigs in this price range. This is a low-end rig in terms of price. For price vs. performance, this is probably the best amateur radio of all time. However, it will not outperform your $4000 rig. You probably won't win contests with it. You will have a lot of fun and own a nearly ideal rig for mobile work.

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver
2) Tweezers
3) Magnifying glass
4) Low-wattage (15 watt) soldering iron
5) Long-nosed pliers

MODIFICATION 1:

Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band transmit. Your memories will be cleared after this modification, since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny diodes, two blank spaces, and one additional diode. They look something like this:

D108

[XX] [XX] [ ] [ ] [XX]

Remove this diode ^^^^

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a low-wattage soldering iron and pull it up with tweezers. Be sure not to damage the other diodes or the PCB. Be sure that you don't apply too much heat, since the heat can damage the PCB and the other diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2:

Enables more sensitive receive above the 2 meter band. (148 to about 162 MHz; after that, sensitivity drops off.) Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper clip in the side of the connector under the wire, push it in, and pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.

```
+-----------------------+
| | *
[XX] [XX] [XX] [XX] [XX] +-O *** J8
*
Solder wire into this hole ^
```

8) Solder a small wire into this hole. Be careful not to pply too much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

# 18216. 706mkii filter

Yahoo group: ic706 (2010 — 2015)
Date: 2010-09-03 15:23:01 UTC
From: Robert Sheskin
Topic: 18216  Message: 18216

I installed a fl-101 in my radio expecting to use it for digital modes. I set it up through the menu and it works fine in cw and rtty modes. Problem is that I use a signalink and usb for digital modes. How can I make it so the radio will allow me to use it in usb?

I think I read something about this, and it involves "tricking" the rig through the set-up menu as to which filter you've got installed.

I'll see if I can find it and pass it along. I have the 1.9 kHz SSB filter (FL-223?) which should work for USB digital modes if I get around to than on one of my 706s. I also have a 7200, which makes all this pretty simple, with a single USB cable between rig and computer, and user-configurable digital filters, so that's the rig on which I do all my PSK-31, etc.

Yep- tell the rig you installed a narrow SSB filter. Then it'll ber available in SSB mode.

From: Larry J. Ford
Topic: 18216  Message: 18219

Found it:

Here's the "blurb:"

"If you run CW or narrowband digital modes like PSK-31, you need a narrow filter. I recommend the FL-232, 350Hz CW-RTTY filter. <SNIP>

Pop the filter in, then go into setup and tell the radio it's an FL-223 (not 232). This will allow you to select the filter in SSB mode, as well as CW and RTTY. This will allow you to select Narrow on SSB and have about a 450Hz wide bandwidth on your waterfall."

and here's the rest of it:

# 18222. 706mkii filter

Yahoo group: ic706 (2010 — 2015)
Date: 2010-09-05 07:02:23 UTC
From: Tyson
Topic: 18216  Message: 18222

Go into the settings menu where you tell it what filter it is and set it as the FL-223. It'll let you select it in SSB that way and, according to the instructions, SSB (as a wide filter?) as well.

I haven't tried this yet but I read this trick from someone else who was using a 706 for psk-31 with one of the CW filters. Let me know how it works.

Hi everyone.

I just joined this group and this is my first post. I was wondering if some can advise on the following problem. The radio has been installed in a minivan for the last 10 years and has been sujected to hot humid summers and cold winters and I just got the IC 706 in the shack to repair(hopefully).

Here is the problem:

The radio seems to have problems tripping some local UHF/VHF repeaters after about 30 seconds of testing and others repeaters it works normal. Power was tested from low to high and it looks as if the finals are O.K with proper power observed on wattmeter into dummy load.

Here is where it gets interesting, it takes a moment until microphone audio is heard on frequency. With the delay I don't think the PL tone has a chance to trip the repeaters in question.

Any advice or suggestions?

Thank in advance

Dan.

Check If radio is transmitting in the frecuency the display actually shows. It maybe few kilohertz out of frecuency.

It works fine on frequency until approx 30 seconds. Then the audio is delayed and eventually audio is distorted and becomes intermittent. It's as if there is heat buildup that causes something to change. The finals appear fine as it has a steady power output with normal SWR. I am trying to find a starting point and wondered if this is a common issue with the 706's ?

I will have access to a service monitor in the next week or so. I'll check for transmit freq. I downloaded the service manual for reference if I need to do a tx re-alignment.

What puzzles me is the delay in audio after 30 seconds keying transmitter. I'll do more testing in all modes and different freq's. I try to post my results as soon as I can.

Hi Jim.
The rx & tx on my Icom 706 Mkii would go weak usually in the summer time
and i too thought it might be related to the heat but it turned out to
be a bad RF coil. I had it fixed and now it works great all year around.

Hi Rakesh.
Sorry. I didn't fix it my self so don't know just which one it was. All i know is that since the coil was replaced my rig has worked like new with no problems.
Guess you'll just have to do some hunting to find the correct one.

# 18237. MK2G Intermittent Transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-03 08:00:12 UTC
From: yellow_kite
Topic: 18237  Message: 18237

Hello

My trusted MK2G suddenly developed a problem. RX okay all bands. TX intermittent, all modes all HF Bands. Sometimes the power comes and then it goes off ( Less than One watt on all HF bands) and suddenly it comes back again to full power. Looks like a loose connection or a relay contact issue.

Earlier symptom was that when cold it shows full power and the problem starts when it heats. This morning it had this problem even from cold start. Again HF RX is 100 % okay all bands and VHF/UHF RX/TX also appears OK.

Any suggestions ? Thanks

73
Rahul, VU2YK

Hi

Must add that I tried cleaning front panel contacts as well as power supply connections. Also did a hard microprocessor reset. No help. Since the power comes back to full value and then goes to almost zero, I suspect a loose connection or even a dry solder. 706 does develop problems like these caused by excessive heat in the body, although it is claimed that because the body is being used as a heat sink, it will get hot. But I never had a any serious heating issue with this rig. Never used it on RTTY etc modes. Always CW and SSB.

Thanks

Rahul

Hi everybody

Had same problem with my Mk II, took the board out, and found that the internal connector from HF/6m out, was loose...
Put it back in, tightened the ground between the pl-antenna-connector and the board, tightened the screws, and now it seemes to be working fine...
(my radio is so old, that the board in the pic didn't look like that at all)

For me the LDG Z100 and AT-1000pro have been fine.
The Z100 is not auto but all the newer ones are.
THe best antenna here is a full wave loop on the lowest band you can fit as high as you can get it.
However anything is better than nothing. I used a coax fed dipole resonant at about 5meg to start with the z100 and 706 original.

Why not try the tuner ICOM designed for the IC-7 series ... the AH-4?

I've used mine for more than 7 years in summer heat [90 - 98F], winter cold [-10F], wind, rain, snow and sleet. It is 100% exposed to the elements! It is mounted in the open bed of a pick up truck, a Ford Ranger.

It's better than the US Post Office for reliability ;-)

A good HF Antenna SYSTEM is the AH-4 feeding a long piece of wire against ground or counterpoise. It's simple and a very inexpensive antenna.

I agree. The older AH-3 and AH-2 will also work with the older 706 as well to my knowledge.

My first "real" HF antenna (not counting the simple little 10-meter dipole) was a random wire (14-gauge stranded bare copper wire) 100-feet long, sloping from about 10 feet off the ground up to an oak tree limb about 35 feet up. I ran a 105-foot counterpoise/ground/radial wire (14 gauge stranded insulated wire from HD) connected to the ground terminal of the AH-4 right underneath the radiating wire. Worked great on 80 meters and up (and would actually tune-up on 160 meters at no more than 50 watts output).

The advantage to using the AH-4 mounted at the base (feedpoint) of an antenna is that the coax between the tuner and the rig is matched to the rig and thus very little loss results. With a tuner mounted at the rig, there may well be a high SWR between the tuner and the antenna, which, depending upon the frequency and quality of the coax, can result in higher losses.

The AH-x series can also be used to match loops, mobile verticals, as Dave describes, and even dipoles/doublets.

A very versatile tuner, with a wide matching range, so long as you avoid the dreaded "half-wavelength."

I've been using an Icom AH-4 for more than 8 years. It's mounted outside
and has survived summer sun and NY and MI winters.

Two questions for you;

1) what bands do you want to work? this will decide your antenna

2) how much room do you have and how much are willing to spend on a tuner

I can also recommend the AH-4. I have used mine mobile tuning a whip at the feed point and portable tuning a 450 ohm fed doublet, 80-10. Worked extremely well....

Brock,
It depends on your operating style and skills. 500 HZ is considered a good CW filter for all types of use. The 250 Hz requires more careful tuning or you will miss an off frequency response to your CQ or contest QRZ. If you chase DX, contest, or like to pull the contacts out on a crowded band get the 250 HZ. A good 250 HZ filter should not have less volume it is just that you hear less bandwidth and it seems quiter. I run the Icom 250 HZ filter in my 706 MK2G but I have been working CW for 56 years. I always year good earphones when operating CW. 73 Ron W8RJL

# 18257. CW sidetone

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-06 12:14:11 UTC
From: newarroja
Topic: 18257  Message: 18257

Hello everyone,

I have a problem on my IC 706 with the CW setting, where the sidetone is always on.

It's a problem that I've had for some time now but because I don't do much CW work, never bothered to look into.

I did play a bit wih the adjustment button's on the side panel, to no avail.

Is this something that someone has experienced before? I'd aprecciate some insight into the problem so I could try to fix it.

Thank you,

Paulo, CT2IWW

# 18261. IC-706MKIIG, Rigblaster PnP and Ham Radio Deluxe

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-10 01:53:59 UTC
From: Matt NM6W
Topic: 18261  Message: 18261

Hi all

I did some digging back and wasn't able to find this question answered in past queries-- if I mis-searched and this is already buried in the archives I apologize. I recently bought a used ic-706mkiig. Works great as far as I can tell, have made contacts on 40m, 2m/440 so far after getting everything set up, just using hand mike and manually tuning etc. Would like to use ham radio deluxe for digital modes as well as for tying the rig into the logbook software so i don't have to hand-jam band/freq/etc every entry.

Im a new ham but my father's an old-timer so after hearing all his horror stories about fighting with serial ports, i figured i'd just buy a rigblaster pnp to try and reduce headaches. maybe it will, maybe it won't. Went by HRO and got that and an adapter cable that goes from the PnP to the 13 pin DIN on the back of the rig (this was with guidance from an HRO smartguy). Today I finally hooked it all up and its not quite there. I went into the settings and verified the CIV ID (58H), set the CIV baud rate from Auto to 19200 (tried 9600/4800 later), and went through all the other Rigblaster and HRD recommended settings. Plugged PnP into PC and it was detected, new com port (COM4), driver's all happy-looking. Baud rate is 19200 (or others as i tried them), 8N1 no flow control.

In HRD i just set port and baud rate, left CIV ID as 58, and left DTR and RTS options unchecked.

When I hooked it all up it quickly keyed the transmitter a couple of times ... seemed reasonable to me. But when i hit Connect in HRD, it times out when trying to read the frequency. Have tried all kinds of stuff-- rebooted PC, switched baud rates (after which I hook/unhook serial port and pwr cycle radio to be sure). nada. Always hangs at the "Reading Frequency" bit and eventually fails.

I'm open to any suggestions including "hey stupid dont use that rigblaster thing" or "ic706 is a good mobile rig but ain't so great with computer control" etc etc.

This is my base station until I move into a new place at which point it'll move to my truck and probably get a K3, so .. if I can't make this work its not the end of the world.

Any tips?

thanks!
Matt

I don't know about rigblaster, but IC-706 is OK with computer
control, I use it as my main station rig in all modes, including
RTTY and other digital modes.

I use to have that same problem. It was such an easy fix that when you look at it and see it you will go DUH and slap your head.

When you start HRD you need to make sure that RTS and DTS is checked that should fix your issues.

Date: 2010-10-10 14:29:33 UTC
From: Alan Bentley
Topic: 18261  Message: 18266

I use the SignaLink USB with my 706MKIIg and HRD. I, too, had trouble getting the CI-V interface to cause the transmitter to transmit. EVERYTHING worked fine, tuning, etc., except for commanding the TX via the HRD software. Teech support at Tigertronics solved it all for me. All I had to change was the Initial Set Mode Item 29 data socket speed (page 54 of the manual) from it¹s default of 9600 to 1200 and it worked.

Hope this helps

Al - K2RXD

Thank you all for the responses, I really appreciate it..

I currently have the "Rig Control" jack on the rig blaster plugged into the rig's CI/V port. Their manual says it should be fine for TTL lvl CI/V control. I did make some more discoveries last night.

I was an idiot and thought that the ACC jack (13 pin DIN) was used for rig control. Oops. Also, the 706 expects a mono plug for CI/V, i had been using a stereo<>stereo cable. I found a stereo->mono tee adapter in a drawer and when i use that on the icom side, I can run DXLab's commander and can see the freqs and tune from the software just fine.. But HRD still will just not connect at all-- whether or not i check DTS/RTS boxes, set initial set mode item 29 to 1200 or 9600, etc etc. uninstalled/reinstalled etc etc, same story.

I think my next steps are calling West Mountain Radio tomorrow, or looking on the HRD forums, since it is working fine for me w/DXLabs' stuff. I'd wanted to use DM780 in HRD but winwarbler works fine from DXLabs so maybe i'll just pitch HRD..

thanks again, 73
Matt

Problem solved with a $3.00 radio shack 1/8" stereo F to mono M adapter. Not sure why DXLabs stuff worked ok with my funny Tee connector but not too concerned.

HRD's quite happy now, woo hoo.

Now to back out all the various tweaks I'd made to try and make it work.

I just got an IC706.  I do mostly CW.  Should I consider getting the 500Hz or 250Hz CW filter?  On other rigs the narrower the filter the lower the volume.  Any advice?

Sincerely, Brock Winfrey

# 18270. 706MKII - no ALC level

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-15 13:59:16 UTC
From: Joe Julio
Topic: 18269  Message: 18270

Hello there,

My 706 MKII has no ALC level in all band, even on 50 ohm dummy load. The power has the follow behavior.

Radio on power position "H"

BAND(m) PWR on Dummy (W) ALC
160 60 no
80 70 no
40 85 no
30 95 no
20 100 no
17 90 no
15 80 no
12 70 no
10 50 no
6 25 no
2 10 no

Radio on power position "5"

BAND(m) PWR on Dummy (W) ALC
160 50 no
80 50 no
40 55 no
30 50 no
20 50 no
17 50 no
15 50 no
12 50 no
10 50 no
6 15 no
2 6 no

Does enyone has any tip to start on?

Thanks in advance,
73 de PY2EJ Joe

Mike,
All measurement was done in SSB with 1 KHz and 400 Hz tone into the mic with 100mv level.
The mic level was in 5.

Also CW and RTTY has the same behavior.

Well more info would help.

ALC is used to control the power output in the radio that uses many components of varying gain. It is a negative feedback control signal that limits the power output. Put your rig in RTTY or FM mode at full power output [setting = 10] and measure the power output with an external meter and a 50 ohm dummy load.

If you have 90 to 100 watts output your radio is fine. It just does not need an ALC feedback signal to limit desired output.

ALC reduces power output. It does not increase it.

That is the point, ALC is a negative feedback system, and I have zero in the display when I set my power on 10, or H, for 706, and I have that table, with this result I should have no control of my output power and technically the output power should be the maximum of my final can provide, please correct me if am I wrong. I?m wandering that some thing is happening on the final or preamps.
Mike and all, I?m using external Wattmeter and Dummy load, and the same appear on my cross needle meter with 50 ohms load inside, the old MFJ949-E.

I just post this question on here just in case to see if someone have had this kind of problem, the rig still with me on mobile operation for about 15 years and so.

Anyway, any help will be welcome.

Hi,

I've had an ic-706mkiig in the car for approx. 6 months. I had to remove it because I had to do a repair job on the car.

The radio worked ok when I removed it from the car. Now, it was time to put it back in, but it would not work. When I press the power button, nothing happens, I've checked all the fuses, also the one in the radio. I have checked the power cord and everything is ok. I have also tested the radio out of the car with a new battery, but with no luck. Does anyone have a suggestion where to start troubleshooting ?

Any help will be welcomed.

Try nipping the pins in the power plug, you will see that if you get a very small screwdriver you can compress them. I had a problem with my 706 shutting down and this seems to have cured it. Also try cleaning the pins/socket on the head unit.

Hope this helps

Before I would do anything else I would break your problem in half, in other words, is there power at the radio ? Take your voltmeter and check it right at the radio to see if the problem is with the vehicle wiring, or with the radio. After that then you can diagnose the vehicle or the radio further. Sounds as if you will see voltage and the problem is within the radio, but it's worth checking. Also, I would check the fuse holder on the power cable just for the heck of it. I've had the ones on my 706 and 756pro both go bad. Just my 2 cents. 73, Sam

You should hear a relay click when you apply power. Do you have a voltmeter that you can verify voltage? Cheap ones can be found for 10 bucks?

I've had an ic-706mkiig in the car for approx. 6 months. I had to remove it because I had to do a repair job on the car.

The radio worked ok when I removed it from the car. Now, it was time to put it back in, but it would not work. When I press the power button, nothing happens, I've checked all the fuses, also the one in the radio. I have checked the power cord and everything is ok. I have also tested the radio out of the car with a new battery, but with no luck. Does anyone have a

suggestion where to start troubleshooting ?

Any help will be welcomed.

Hi,

Thanks to all who have offered suggestions for my problem. I have tried them

all, but there is still no lights on the display. I have checked all fuses,

including the one inside the radio, I have checked the power cable, checked

and cleaned the pins on the display connector. Everything is OK, but still

there is no power on radio.

Try nipping the pins in the power plug, you will see that if you get a very

small screwdriver you can compress them. I had a problem with my 706

shutting down and this seems to have cured it. Also try cleaning the

pins/socket on the head unit.

Hope this helps

Have you checked the internal fuse?

The manual for the 706MKII says there's a 4 amp fuse in the PA section. The reference is in the "Maintenance" Section of the manual - don't know about the MKIIG manual.

Also, under the "troubleshooting" Section of the manual, for a "No Power" condition, it references checking both the "inline" fuses in the power cord, and the internal fuse.

Also, it references making sure the DC power cord/connector is installed properly.

Hope this helps.

You should hear a relay click when you apply power. Do you have a voltmeter that you can verify voltage? Cheap ones can be found for 10 bucks?

I had a similar problem with my 706MKIIg. Drove me crazy. Relay clicking....power up...power down..up..down. Then eventually no power at all.
I tried all the things previously mentioned and then some. I finally sent it to Scott Malcom. I don't have the email anymore but he told me that the (one of) the PLL traces was corroded. It seems that ICOM has used something on their boards that can have corrosive effect on the etch. Total repair was around $50 including shipping. Works fine since.

If you havnt, I would check voltage on the power plug inside the radio to be sure it's getting all the way. Beyond that I don't know. You've already cleaned the remote head contacts with alcohol and a q tip. I'm not sure if you hear the relay every time but you should after it's set overnight for sure.

The radio worked ok when I removed it from the car. Now, it was time to put it back in, but it would not work. When I press the power button, nothing happens, I've checked all the fuses, also the one in the radio. I have checked the power cord and everything is ok. I have also tested the radio out of the car with a new battery, but with no luck. Does anyone have a suggestion where to start troubleshooting ?

Any help will be welcomed.

Mike, Yes I have checked the plug inside the radio, and there was voltage. I don’t hear the relay clicking at all.

Subject: Re: [ic706] No power

If you havnt, I would check voltage on the power plug inside the radio to be sure it's getting all the way. Beyond that I don't know. You've already cleaned the remote head contacts with alcohol and a q tip. I'm not sure if you hear the relay every time but you should after it's set overnight for sure.

Happy QSO'ing. Mike R

You should hear a relay click when you apply power. Do you have a voltmeter that you can verify voltage? Cheap ones can be found for 10 bucks?

Try nipping the pins in the power plug, you will see that if you get a very
small screwdriver you can compress them. I had a problem with my 706
shutting down and this seems to have cured it. Also try cleaning the
pins/socket on the head unit.

Hope this helps

I had a similar problem with my 706MKIIg. Drove me crazy. Relay clicking....power up...power down..up..down. Then eventually no power at all.
I tried all the things previously mentioned and then some. I finally sent it to Scott Malcom. I don't have the email anymore but he told me that the (one of) the PLL traces was corroded. It seems that ICOM has used something on their boards that can have corrosive effect on the etch. Total repair was around $50 including shipping. Works fine since.

# 18297. Power Spike on IC-706

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-19 19:38:54 UTC
From: Larry J. Ford
Topic: 18297  Message: 18297

I've been working on bringing an AL-80A amp back from non-use (bought from the estate of an SK), and the other night was using my 706MKII as the "exciter" to test output, etc.

Got an obvious demonstration of the 706's known penchant for "leading edge" power spike, which I think Phil Salas and some others have written about.

Even with the output RF power on the 706 dialed-down low (e.g., starting with 10 watts) to bring the tube in the amp up slowly, the initial spike was well over 100 watts as indicated on an Ameritron AWM-30 peak-reading wattmeter.

I think Phil or someone published a project kit to attenuate the output in such circumstances. Anyone have a link to that or a copy?

Thanks and 73,

Larry J. Ford
KG4GPJ

How much drive does the AL-80 take? You could mod the amp with an attenuator after the switching relay so it takes all 100W for full drive...

# 18299. Re: [ic706] Power Spike on IC-706

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-19 21:27:31 UTC
From: Larry J. Ford
Topic: 18297  Message: 18299

The manual for the AL-80A states that "maximum allowable drive" is 100 watts; "normal drive" for rated output (1 KW SSB) is 85 watts according to the manual.

I was observing spikes peaking well above 100 watts; I believe I read (perhaps in the Phil Salas article or elsewhere) that the output from the 706 on spikes before the ALC kicks in could reach 150 watts.

The Eimac 3-500Z tube in the AL-80A is a pretty tough tube, but even momentary spikes 50% over the maximum drive specified can't be good for the tube in the long run.

Once I get the AL-80A to the point where I replace my AL-811 with the AL-80A, then it will be driven by an IC-7200, which I've noticed appears to control those momentary power spikes better than the IC-706.

I think it would do fine- I think that tube is more sensitive to too much filament V than a short spike. When I had my Henry 3K-A, I had the fils as low as I could get them, with the HV as high as I could get it (4kV). I lowered the fils V on my TL-922 as well. It was grossly high on that amp. Something like 5.8V, where it should've been more like 4.8-5V.

The AL-80A and 80B use a single 3-500 tube as the power source.

I easily run 80 to 100 watts into my 80B. The 3-500 is RUGGED. In 9+ years of operation I have zero issues.

A millisecond range spike is not going to hurt it. In the GG configuration all of the input power appears in the output.

I suspect the 80A T/R relay takes more time to switch than pulse width of the 706 'spike'.

My recollection is that the spike is a non-issue with tube amplifiers. It is an issue with some solid state amplifiers.

Hi Larry - I added a relay-switched attenuator between the transceiver and amp so you can leave your transceiver set for full power. So no spike since you are already at full power. The info is in the "Articles" section of my website at www.ad5x.com. This works great, and it is handy for all transceivers since you don't need to worry about cutting power back when you put any amp on line.

Subject: [ic706] Re: Power Spike on IC-706

Hi Larry - I added a relay-switched attenuator between the transceiver and amp so you can leave your transceiver set for full power. So no spike since you are already at full power. The info is in the "Articles" section of my website at www.ad5x.com. This works great, and it is handy for all transceivers since you don't need to worry about cutting power back when you put any amp on line.

Lots of good stuff on Phil's website including a fix for instability problems on 15/17m. Take a look.

P.s. Phil, i thought so much of it I already had it saved to the home screen of my I phone. Thanks from hams everywhere

# 18305. 12v DC on speaker line 706mk2

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-20 19:59:31 UTC
From: dansupplee
Topic: 18305  Message: 18305

my 706 has 12 volts dc on the speaker line and will smoke a speaker in seconds. After looking at the schematic I figured that it was a bad dc blocking cap after the audio amp but that was good. If I plug in a jack in the front phone jack I have 12 volts dc on it but not on the main speaker line. I assume that it is a short some were but I can't find it. Has any one run a cross this problem? Any ideas would be appreciated.

# 18306. Convert 8-pin ICOM Modular Mic Connector plug to 8-pin ICOM Round Mic Connector

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-25 16:03:14 UTC
From: Larry J. Ford
Topic: 18306  Message: 18306

I have a headset that's set-up with the 8-pin ICOM Modular Mic Connector plug (i.e., for a 706) that I'd like to use with an ICOM 7200 that uses the 8-pin round ICOM mic connector.

Any easy way to rig up a conversion short of buying the MFJ-1251 "UNIVERSAL MIC CONVERSION BOX,"[1] or just wiring the leads/pins from a CAT 5/RJ-45 socket to an 8-pin round mic connector?

I'm hoping that I'm overlooking something easy and obvious.

If you are smart, And I assume that you are, Lose that worthless rj connector and wire an 8 pin connector. The rj type of connector was NEVER intended to be used in this manner. They were intended to be used for netowrk cables which are not subject to wiggling and twisting, pulling and all the other stresses which use as a headset/ Microphone cable puts on them. I have replaced the RJ on many rigs, including my own iC-706 , and I am justabout done with radios with this improper connector. Just a heads-up from someone who has had too many nightmares with thes connectors.

That would be the ultimate solution to a bad mic system,but, I fear that it would be a "hard" fit.
Actually, what I was refering to,is the connector on the headset to the base station rig.

That's true; I've got a Heil Traveler I'm using exactly like that with an IC-7200, which has the 8-pin round connector.

The headset I was referring to when I started this thread has an 8-pin modular connector designed to work with the 706, and I was looking for a way to use it with the 7200.

Jack, I think he's wanting to go the other way and use the rj45 mike
on the 8 pin radio.

Larry, it won't be pretty unless you put it in a box of some sort but
since you already have the 8 pin adapter, you could build a adapter to
do what you need and it would be easy to figure, pin to pin. You'd
need the radio end and the mic end but their might be a easier way.

Probally a cat 5 cable would be easiest and a rj45 double female.

# 18317. Re: [ic706] Convert 8-pin ICOM Modular Mic Connector plug to 8-pin ICOM Round Mic Connector

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-27 20:11:44 UTC
From: Joe Isabella
Topic: 18306  Message: 18317

Then just get another 8 pin mic connector, lop the end off a good piece of Cat5, and put the mic connector on the cut end, and a double-female Cat 5 coupler on the other end. Plug the headset into the double-female coupler. I've been using my original 706 mic on my IC-820H like that for years....

Sent from my Verizon Wireless Phone

One caveat to this solution is to make sure you are using a reversing coupler. I have examples of both reversing and non-reversing in my adapter drawer.

Regards,
Ed

From: m6jjk
Topic: 18319  Message: 18319

hi to all in the group

i have now been licenced for just over a year and had a lot of fun in that period. i am still using the IC 706 and havent had any problems with it.

i have decided to have a go with PSK3 and other data modes and thought that a nice christmas present from the yl would be this data cable. not the most expensive of presents but im sure it will get a good lot of use once i feel my around it all.

i was just wondering what your opinions are of the IC706 in data mode.

not much of a question i know but if i have as much fun with it as i have had on the normal ssb modes with the mic, im gonna be very happy.
hopefully some of you will give it lots of praise ?

I've used mine with a homebrew interface many times on PSK31- works very well. Just make sure yoh run the power down to about 30W, and probably no more than 50W for short transmissions. The rig will get quite hot otherwise.

If you have any specific questions, feel free to ask- that's what we're here for. You can also search in here as well. Enjoy & welcome to Amateur Radio...

Being an old fashion Ham, I would suggest making your own interface cables for psk and other data modes. It is easy and educational. If you want to start playing with psk now, forget the cables and just acoustically couple between the speaker and mic of the computer and radio. It works just fine, I know.

If you want to have fun someday without the radio, get 2 computers in a room running a data program and have them talk to each other "through the air" from computer speaker to computer mic.

Welcome to the hobby.

Cliff,

I'm somewhat of a beginner with amateur digital modes too -- but here's my experience with the IC-706. I got my license a couple of months ago but do have a lot of RF/comms/computing experience from my day job..

It's my first radio. I picked it up used, and went out and bought a Rigblaster PNP with the right cables for the Icom radio. So the rigblaster plugs into the ACC jack as well as into the rig control jack (mono plug on the radio side I think). Rigblaster also connects to my laptop via USB, and mic/spkr audio jacks.

I was up and running with PSK31 on 20m (once i got my antenna/tuning/other issues worked out) in about an hour of playing with audio settings on my computer, and with getting Ham Radio Deluxe and DM780 to talk to the rig. I got pretty stymied at first by thinking that rig control was through the ACC connector-- I hadn't had rig control connected at all (dummy) but that was pretty easy to get fixed.

I set xmit audio to about 60% and did just fine. Have been worried about "splattering" like you see sometimes but have had reports of very good, clean signal.

The only issue I have is occasional trouble picking out weaker signals in the waterfall. It's been suggested to me to get the IC-706 CW filter, and tell the Radio it's an SSB filter (so you can use it in SSB for PSK31) .. but I just live with getting what i get without it as I hate to spend over $100 for that. I have zero to compare this radio to so I would NOT say its a sensitivity or filtering issue-- it just is what it is.

For my first radio I am tickled pink. It has been SO easy to get PSK31/63/125, Olivia, RTTY (AFSK) contacts that I haven't done enough phone and haven't started learning CW yet. I love this thing for digital modes. Got my first Japan and first RTTY contact a couple of weekends ago during the JARTS contest. Super cool :)

Hope this helps. If I can help out let me know.

73,
Matt Wilbur

I've used my 706 with a SignaLink USB to work just about all of the data modes that were available at the time (2 years ago). Works Fine - Lasts Long Time! :-)

Serously, once the radio, interface, computer, software combination is working, it's all about the antenna.

I have been using mine for many months for digital, I have run SSTV at full power on 90 second plus keydowns and my radio just gets a little warm. I have a small computer case fan sitting behind my radio, against the heat sink, blowing away from it. I have always run it that way, you can pull the power from the acc connector so it comes on with the radio power. For radio connection nothing is easier than the SignaLink. If you use the windows sound card you will wind up transmitting windows sounds. If you also want CAT control be careful, I have a ebay special usb adapter with a Prolific chip and it does not play well with some of the software although I have figured my own work arounds. 73, Bob N3PPH On 10/28/2010 2:01 PM, Joe Isabella wrote: > >

Hello Cliff, I used my 706 11G for PSK etc running at 30W, it got hot and I had a fan blowing on it.
After a couple of years I did get trouble with overheating; some damage was done to the main board.

I like the 70611G but I no longer use it for data modes.
Good luck,
Barry M0IOW

# 18326. Icom IC-746, IC-706 Mk II G, and other Icom FS

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-29 14:13:48 UTC
From: Ken Simpson, W8EK
Topic: 18326  Message: 18326

Icom items For Sale:

Icom IC-746, 160 thru 2 meter transceiver

The Icom IC-746 covers 160-10 meters plus 6 and 2 meters. 100 Watts of output is available on all bands - HF, 50 MHz and 144 MHz, making the IC-746 a practical choice for all-around base station use. The die-cast aluminum chassis and a large cooling fan help to stabilize the PA circuit, providing 100% full duty cycle operation. It has 100 alphanumeric memories, spectrum display, Twin PBT, CTCSS encode / decode, APF, two stage preamp, keypad entry, automatic antenna tuner and electronic keyer. DSP digitally transposes receive audio components in all modes of operation to produce desired AF frequency characteristics at the IF stage of the transceiver. This built-in DSP provides: noise reduction, automatic notch filter and selectable APF. The digital bar graph meter displays ALC, power output and SWR simultaneously! The radio automatically selects from the three separate antenna inputs (HF, 6 meters, 2 meters). A built-in automatic antenna tuner operates on the HF bands plus 6 meters. The rear panel has three antenna jacks. The 746 requires 12 VDC at 20 amps.

Features include Spectrum Scope, 102 Memories, RIT/XIT, Noise Blanker, VOX Function, Selectable APF, Dual Display, 100 Watt Output, 40 Watt Output (AM), Built-in Automatic Antenna Tuner 180-6 Meters, Full Break-In CW, CW Keyer, 100% Duty Cycle, Rx Antenna Jack, DSP Notch, 1 Hz Readout, Memory Keyer, RF Attenuator, and much more.

This particular unit works 100% as best I can tell. It looks very close to new, and is in its original box, with paper work for $750.

Icom IC-706 Mk II G 160 thru 2 meter transceiver:

The '706' Series represents one of the most popular transceivers in amateur radio histroy. The latest version is the incredibly small Icom IC-706 Mark II G which adds many new features and capabilities not found in previous versions. The "G" is an all-mode transceiver that provides 100 watts on HF and 6 meters and 50 watts on 2 meters plus 20 watts on 440 MHz. It receives from 30 kHz to 199 MHz and from 400 to 470 MHz. It features a removable, remoteable, front panel that allows control of all features. The large LCD display features alphanumeric memory names (9 character) and soft key descriptions. The LCD even

supports a simple band scope display. Other advanced features include: IF Shift, RIT, Tone Squelch, Scanning, Noise Blanker, Speech Compressor, Mini Spectrum Scope and Electronic Keyer. This latest version in the 706 series includes the UT-106 DSP module as a standard feature. Despite its compact size (6.56" x 2.28" x 7.88"), it has big, easy to use control dials. With HM-103 hand mic. One or two optional filters may be added.

Features
* .03-199, 400-470 MHz Receive
* Alpha memories
* RIT
* Preamp/ATT
* VFO A/B
* 1 Hz Display
* IF Shift
* Scanning
* S/RF Meter
* 100 Watts HF+6M
* 50 Watts 2M, 20 Watts 440
* 100 Memories
* All band Multimode
* Removable head
* Mini Spectrum Scope
* Electronic Keyer

This one works 100% as best I can determine. It looks extremely nice. Microphone and paper work are included for $650.

Icom MB-62 Mobile Mounting Bracket
The MB-62 is the mobile mounting bracket that is used for the Icom 706 series, IC-703, and for the AT-180. $20

Ameritron ARB-704 Linear Amplifier Keying Interface

The ARB-704 advanced interface is compatible with all common radios and amplifiers.

The input is designed to be compatible with any transmitter or transceiver, and the output is compatible with AC control lines or DC positive or negative amplifier control lines having up to 200 Volts peak open circuit voltage and 300 mA of operating current.

The ARB-704 has many electrical advantages over conventional relay buffer systems. The ARB-704 has no moving parts so it switches almost instantaneously.

This one is new, in its box, with everything that came with it originally, including all cables, and manual. MFJ sells them for about $60. Buy this one for $45.

Ameritron PNP-7D "Quick Connect" Cable for most Kenwood rigs
(TS-440, 950, 130, 2000, etc.) to ARB-704. New. $12

Coaxial antenna switches:

All have SO-239 connectors, and work 100%.

B & W Model CSR-5G (also known as 376)
This model will switch up to 5 antennas, grounding
all unused antennas. It has SO-239 connectors, with
the coax coming out like spokes of a wheel.
This one works 100%. With paperwork for $45.

MFJ 1702 B, 2 position
Heavy die cast housing, with a center position
to ground both antennas. Works great, and looks like
new. $22

SWR Bridges:

Both have SO-239 connectors, and cover from 3 to 150 MHz,
covering HF, 6 meters, and 2 meters, so they are ideal for the new
rigs with 6 meters and 2 meters in them.

Quement SWB-2 Dual Meter
This unit features two separate meters -- one for reading forward
power and another for reading SWR. This permits one to easily
monitor both the power going out, and the SWR on the antenna.
Works fine and looks great. With paper work for $40

Royce 2-100 Single Meter SWR Bridge / Field Strength Meter
This one works fine, and looks extremely nice. I do not see
any scratches on it, but it does have a previous owners name
on it. In its original box with original instructions. $32

Astron RS-12 A, 13.8 Volt DC Power Supply

This power supply is rated at 9 amps continuous and 12 amps ICS.
It is ideal for most 2 meter rigs, including the 50 Watt rigs.

This Astron power supply features solid-state electronic
regulation, EMI filter, fold back current limiting for protection
from excessive current and shorted output, and crowbar over-voltage
protection.

This particular supply works 100% and looks the same. I can not find
a scratch on it. With paper work for $50.

I also have many other accessories available such as
microphones, wattmeters, keyers, etc. Just too many to list
here. Please e-mail your requests.

Icom HM-70 Speaker Microphone:

The Icom HM-70 speaker mic (also known as the EX-1036)
works on the Icom 2SRA, 4SRA, Delta 1, IC-W2/X2 or any
Icom HT which uses the single 3 conductor stereo-style
1/8 inch (3.5 mm) plug.

This one is in the original box, and appears to be unused.
$25

Dead Icom Battery Packs:

Please note that all of these battery packs are dead. There
is no voltage from them. They are being sold for the purpose
of rebuilding, or to be used to build a regulator in them,
or whatever.

Batteries for Icom 2AT, 3 AT, 4 AT, 02AT, 03AT. 04AT, 24,
and others:
BP-2, looks very nice $5
BP-3, looks like it may have gotten warm, and may be slightly
deformed $4
BP-4, "Empty case" for alkalines, etc. Needs cleaning. $8
BP-5, larger pack, looks good, but has former owners call
sign scratched in case, $5
Buy all four of the above for $20.

ORIGINAL Icom operating manuals:

Please note that all of these are original Icom manuals
and are not copies. All are in very good condition.
These are original manuals only.

BC-30 Desk Charger $5
BC-35 Desk Charger $7
BP-2, BP-3, BP-4, BP-5 battery packs $3
BP-21, BP-22, BP-23, and BP-24 Batteries $3
DC-1 DC pack for IC-2 AT series HTs $4
HM-8 Hand Microphone, w/schematic $5
IC-22 S, 2 m FM transceiver $12
IC-3 PA Power supply / speaker $10
UT-16 Voice Synthesizer $5

These are original manuals only.

Prices do not include shipping from Florida.

Thanks.

The Group,

Here is the latest regarding my IC-706MkIIG.

I got it back from the repair shop yesterday, and now it's ready to be put back in the car. The reason for the "No Power" condition was several bad / broken solder points on the PLL board. They are repaired with new solder, and now the radio is working as it should.

Subject: Re: [ic706] No power

Have you checked the internal fuse?

The manual for the 706MKII says there's a 4 amp fuse in the PA section. The reference is in the "Maintenance" Section of the manual - don't know about the MKIIG manual.

Also, under the "troubleshooting" Section of the manual, for a "No Power" condition, it references checking both the "inline" fuses in the power cord, and the internal fuse.

Also, it references making sure the DC power cord/connector is installed properly.

Hope this helps.

Hi,
Thanks to all who have offered suggestions for my problem. I have tried them all, but there is still no lights on the display. I have checked all fuses, including the one inside the radio, I have checked the power cable, checked and cleaned the pins on the display connector. Everything is OK, but still there is no power on radio.

Try nipping the pins in the power plug, you will see that if you get a very small screwdriver you can compress them. I had a problem with my 706 shutting down and this seems to have cured it. Also try cleaning the pins/socket on the head unit.

Hope this helps

Hi,

I've had an ic-706mkiig in the car for approx. 6 months. I had to remove it because I had to do a repair job on the car.

The radio worked ok when I removed it from the car. Now, it was time to put it back in, but it would not work. When I press the power button, nothing happens, I've checked all the fuses, also the one in the radio. I have checked the power cord and everything is ok. I have also tested the radio out of the car with a new battery, but with no luck. Does anyone have a suggestion where to start troubleshooting ?

Any help will be welcomed.

# 18330. IC-706 MKII Vs. IC-735.

Yahoo group: ic706 (2010 — 2015)
Date: 2010-10-31 03:55:31 UTC
From: lu8ehr
Topic: 18330  Message: 18330

Hi friends !!!

I'm a proud owner of a IC-706MKII ( no G ), use it only in my base station and want to know your opinion about HF perfomance of old IC-735 tcvr against it.

May be, a bunch of You have experience with both models.

The question arise because two reasons :

-I like contests and, in this ambient, I see '706 like a litle limited performer ( dinamic range issue and the like ).
-I have an oportunity to buy a '735 at a good price.

Anyway, not flame intent at all.

Very thanks in advance for your kind attention,

It definitely came out in the 80s, and I have used one quite a bit. While adequate, I wouldn't put it against even rigs built a few years later. There are far better choices out there especially for contest rigs. Things like 2nd & 3rd IF filtering + true IF DSP are a huge improvement over both of those rigs IMHO.

And don't get me wrong- both are good for what they were designed for (and when they were designed), and I'm not flaming. I'm just saying there are better choices out there for contest rigs...

Honestly, I don't recall there being much of a difference in performance between the two. In fact, the 706 has a few extra things going for it the 735 doesn't. Like 6/2m, audio DSP (that was available on the MKII, right?), etc. I don't think RF-wise, they're that different, and I mean in the IF chain. So really, It would come to price & whether or not the extra features were important.

I've used both in contests, and while they WILL work, neither holds a candle to the more modern radios, our even my 950 SDX, which I'll never get rid of. It performs on par with the more modern rigs, and was WAY ahead of its time....

Yes, with the IC-706 MKII, there was an optional DSP "add-on," the UT-106, that added ANF and NR features. I have a 706 MKII that has that unit installed, and it works reasonably well.

I don't know if the DSP came "standard" or built-in with the IC-706MKIIG.

# 18336. Transmitting issue

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-01 02:50:50 UTC
From: John
Topic: 18336  Message: 18336

My 706mkll is not longer transmitting on the receiving frequency. It transmits about 1 1/2 kc low. I have checked offset and split settings and all seem proper. Had been working properly until a few weeks ago until a net told me they were having to tune to get me in clearly. Any ideas would be appreciated. john, WA8KIW

John on HF or vhf/uhf?
on HF check the RIT it is a black button between the volume and memory knobs
IF you were on HF and it was pressed that could seperate your TX from the
RX.

Hello,

On HF, check RIT.
On VHF, check fm vco adjustment in service manual...
BUT start with a total reset of radio.

98% of my operating with this rig is on HF. It was first noticed on a daily 75 meter net and later noticed on 6 meters.
I have checked the RIT and that is not the problem.
I have not done the total reset tho.

Topic: 18330  Message: 18340

I would like to mention that if your looking at older icom rigs to look at the 761&781 I think I got those numbers right. They're pricey and I believe they have filters in two I. F.'s similar to the yaesu ft-1000 series. I think the 761 is a rack mount style with 200w. You can probally pick up a 735 for a song.
The 706 is a great little radio. Does anybody know how many were sold? I've been using one for several years as my only two hf rigs. A mk2 and a mk2g. I've been longing for a new bigger rig for a while and saving my money.

Back to the 735, I think there are better choices unless budget constraints are the driving factor.

It definitely came out in the 80s, and I have used one quite a bit. While adequate, I wouldn't put it against even rigs built a few years later. There are far better choices out there especially for contest rigs. Things like 2nd & 3rd IF filtering + true IF DSP are a huge improvement over both of those rigs IMHO.

And don't get me wrong- both are good for what they were designed for (and when they were designed), and I'm not flaming. I'm just saying there are better choices out there for contest rigs...

I've read that the 706 series is the biggest selling single transceiver in amateur radio history, with sales in excess of 70,000 units.

I would have thought it would have been more units, but that's still a lot.

I really shouldn't comment but if it recently shifted 1.5kc then I would think something failed or changed value. A total reset is worth a try. All bands?

You may want to take a look at the IC-735 Yahoo group before you make your decision:

http://groups.yahoo.com/group/IC-735/

I have both an IC-735 and IC-706MKIIG. I bought the IC-735 new 25 years ago. Even though it is a good little rig, the technology is old and they do suffer from some "age" issues like the original trimmer capacitors going bad and needing replacement (I just had this done on my IC-735).

I think $500 is high for a rig this old with some known issues that arrive with age. You may want to review the IC-735 group and get a feel for what issues the IC-735 has and whether the one you want to buy has had any of the same issues resolved through maintenance.

That will be a tricky measurement.

The polarity of the measuring instrument is a key factor. Reversing the meter will show a major change in value. due to the fact that the meter biases the semiconductor junction.

I believe from ancient posts that the final amplifier is ALWAYS connected to the power source.

If one has the rated standby current and at a rated standby voltage, one should be able to calculate the expected resistance.

Agree. Power OFF, the impedance should exceed 13.8 Kohms.

We could ask "dansupplee" why he is asking the question. Does he have a problem? Is he just curious? Or, is concerned about power drain in a mobile while the vehicle is non operating?

With most electronic devices the rated standby current and voltage will tell little about the measured resistance.  Also it can depend on the ohm meter being used.  Many times an old analog meter such as the Simpson 260 will show differant than a digital meter.  The digital meter will not bias the diode junctions in to conduction where the Simpson may.

Subject: EXTERNAL: Re: [ic706] resistance between positive and ground

That will be a tricky measurement.

The polarity of the measuring instrument is a key factor. Reversing the meter will show a major change in value. due to the fact that the meter biases the semiconductor junction.

I believe from ancient posts that the final amplifier is ALWAYS connected to the power source.

# 18351. Adino- Icom Authorized Service Center in India

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-13 09:22:46 UTC
From: yellow_kite
Topic: 18351  Message: 18351

I really wish people share information on these forums quickly to avoid disasters like one I mention hereunder.

I gave my ICOM IC706Mk2G for repair to One Mr Sarkar at Adino Telecom New Delhi, who apparently are one of ICOM's authorized service centers in Delhi.

The radio had a minor issue that the power output was intermittent. It was in all probability a dry solder. Not willing to risk to open the radio myself, I chose to give it to "professionals" at Adino.

After several weeks of dilly dallying and avoiding us, the radio has been returned back to us in a completely messed up state. The radio was working with 100 % OK on RX and intermittent TX. All other functions were absolutely in perfectly working order. Now the radio does not even power up and is completely lost case. Mr Sarkar wanted me to leave the radio with him for an "indefinite" period.

I later found out similar horror stories from other hams who have burned their fingers at the hand of Mr Sarkar and Adino. As it turns out, they are both incapable and incompetent and also they do not have well equipped service stations that such sophisticated electronics demand.

Think twice before you buy any ICOM gear in India and think 10 times before you give it to Adino or any Delhi service center for repairs.

Rahul

If they are an authorised Icom service centre it may be worth you raising the matter with Icom in any case if you feel that you have not been given good service it would be best to bring it to the attention of Icom.

Being authorised implies some sort of standard or set minimum standard by Icom, you say they are "apparently are one of ICOM's authorized service centers in Delhi" it might be best to check and see if they are??

Regards

Peter G4SST

Sir,
Your comment about Icom gear is unfounded. I have had my 706 for many years with NO problems I would buy more Icom with out any hesitation at all. as for the service center there well that is a service center NOT ICOM if you have a problem with them contact ICOM and they can tell you whom to send the radio to ass well as they can then know of the problem with that center. IF they have in fact caused more harm to your radio and charged you for what they have done then contact your legal system there and see what they can do I know your laws on comerance are allot different then what it is here in the USA.

Posted by: "yellow_kite" yellow_kite@...  yellow_kite
Sat Nov 13, 2010 1:22 am (PST)

I really wish people share information on these forums quickly to avoid disasters like one I mention hereunder.

I gave my ICOM IC706Mk2G for repair to One Mr Sarkar at Adino Telecom New Delhi, who apparently are one of ICOM's authorized service centers in Delhi.

The radio had a minor issue that the power output was intermittent. It was in all probability a dry solder. Not willing to risk to open the radio myself, I chose to give it to "professionals" at Adino.

After several weeks of dilly dallying and avoiding us, the radio has been returned back to us in a completely messed up state. The radio was working with 100 % OK on RX and intermittent TX. All other functions were absolutely in perfectly working order. Now the radio does not even power up and is completely lost case. Mr Sarkar wanted me to leave the radio with him for an "indefinite" period.

I later found out similar horror stories from other hams who have burned their fingers at the hand of Mr Sarkar and Adino. As it turns out, they are both incapable and incompetent and also they do not have well equipped service stations that such sophisticated electronics demand.

Think twice before you buy any ICOM gear in India and think 10 times before you give it to Adino or any Delhi service center for repairs.

Some things to note...
The caps in the radio are rated for 16v. The internal regulators will handle up to 16v but will generate more heat at higher voltage. The finals will produce more power during transmit and also more heat. I would suggest that you do the fan mod (posted in the forums here) to reduce the small extra stress placed on the radio and you should be fine.

One last thought,
Is this a mobile installation? Is there any noise on the DC voltage from the alternator? (place the volt meter into AC mode and measure) If there is AC noise on top of the DC voltage, the added amount may exceed the ratings of the component in the radio and over stress them. You may need a DC filter.

Charles, I did not tell him he was wrong, But I did say I have not had problems with mine that would cause me to think twice about ICOM, Now I will say there are repair centers I would tell people straight up that they would stand a good chance of getting ripped off if they used them, There are other service centers that are great.

But in regards to speaking your mind....with your call I would say you live in the USA, Living in the USA we have the WONDERFUL freedom of Free Speech.
Are you a service man?
Have you served the USA?
Are you a Citizen of the USA?

IF you answer NO the either of the first two then thank a Service man.
IF you answer NO to the third question, Then sit down and hold your tongue till you have the right to claim it.
IF you can answer YES to ALL three then I thank you for your service.
I have done my service.

What I feel is that Icom is appointing their Delaers here in India
without checking their credibility, without testing their technical
competence....
Or is it that getting Icom dealership is easier than that of Kenwood and Yeaseu
!!!!... Surprisingly, Icom has more than one dealer in New Delhi...Is Icom
dealership/service center available "Cheaply: !!!! Are they Just giving/
throwing Dealership on first cum first service basis!!!!

After reading unpleasant, painful Icom radio repair experience of vu2yk, I have decided, if ever I import/ buy my next radio, I will think twice before I buy an Icom set.

From: Rakesh Kapoor
Topic: 18369  Message: 18369

I have two power supplies, one MFJ 4125 and other Icom PS-55. MFJ supply gives about 13.60v and PS55 is giving 14.8 v.....when I use my IC706mk2g with MFJ supply, which gives 13.6 v, I get near 65-70 watts output and when I use PS55, which gives 14.8v, I get 100 watts output. What shall I do!?, shall I use MFJ for safety of the set or shall I use PS55 to get near 100 watts out !!!!!!!! any suggestions ????

Are you sure you volt meter is accurate ?  If so The power output seems low as yuo should get about 100 watts out with 13.8 volts. Maybe wattmeter is low.

I think I would adjust the PS-55 back to 13.8 volts and use it.

Gentlemen,

Thanks for your replies and valuable suggestions. I must set the record straight. I haven nothing against ICOM radios. I own 5 numbers of 706Mk2Gs and they all perform flawlessly. One I have carried with me all over the world in my travels and it works every time I connect it to power and antenna. I also own at least five other ICOM radios including an IC-7000. The issue was with the particular ICOM service center in my country. If they had returned it to me in original condition, I would not have felt offended. As sometimes it is genuinely not possible to service products outside their country of manufacture. What upset me was their unprofessional attitude and conduct, which was unbecoming of the authorized representative of an electronics global major.

I hope you will understand my frustration of someone who has been a very active ham for nearly forty-five years, give a radio for service and it comes back manhandled and beyond repair. I do sincerely apologize if I hurt some sentiments, for such was never my intent. As is clear, I have tremendous respect for Icom as a manufacturer of quality ham radio equipment for several decades. But buying an expensive radio in a country where there is no back up support is fraught with hazardous consequences. To add to our woes, it takes tonnes of paperwork to ship radios out of country and another tonne when getting it back. That could be on reason hams here are wary of investing in expensive,high end radios.

Dear Mike,
I checked on RTTY as well CW mode. With MFJ, I get about 65-70 watts and with PS55, I get 100 watts on RTTY mode of the radio. MFJ without load is 13.60v and PS55 is 14.8v, again without load. Using the original DC cord. Will do some more testes tomorrow. I have another supply, SMPS, set for 13.8v without load, will use this one and check what power out I get from 706.

That will be a tough call to make. The icom may be better quality. Was it designed for 13.8 if so it may be under load.
Weall want our 100w but you may not notice much or any difference at 70. Decisions decisions.
One idea. You might find out what radio that icon supply was paired with and see if anyone has had any problems and if that's normal voltage.

The Icom supply is suspose to put out 13.8 volts as stated in the Icom manual. If his is putting out about 1 volt more than that, the voltage needs to be adjustd back down to 13.8 or the supply needs to be repaired if the voltage will not adjust.
It is designed to operate with another 100 watt output Icom rig.  The current rating is enough for the 100 watts out of the 706.

Thanks Ralph. I think what I would do is adjust the icom supply to 13.8 and then check it under transmit load as well as rf power out and go from there. If your not getting 100w out under that condition then we can discuss further but if it's adjustable down to 13.8 I would start there.

That will be a tough call to make. The icom may be better quality. Was it designed for 13.8 if so it may be under load.

Weall want our 100w but you may not notice much or any difference at 70. Decisions decisions.

One idea. You might find out what radio that icon supply was paired with and see

if anyone has had any problems and if that's normal voltage.

Happy QSO'ing. Mike R

# 18385. 706 and pwer supply

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-15 15:30:13 UTC
From: Rakesh Kapoor
Topic: 18385  Message: 18385

I did some tests today again. I used 3 different power supplies with my IC706 radio. I found that with 13.60v, (MFJ-4125) radio output is 65 watts on RTTY/CW mode, with 14.05v (Meanwell SMPS) it is 100 watts and with 14.8v (PS 55) it is litttle over 100 watts. That means my MFJ-4125, which gives 13.60v, required to be adjusted to near 14.v output. I see that there are 3 variable resistors in the MFJ4125 circiut, I do not excatly know which one to adjust to get 14v output...any idea on that???

Something I'd verify is to make sure you're not getting any
voltage drop across any of the connectors or fuseholders. I
just checked my 706 on the bench and I can get a full 100W out
down to just below 12V input at the radio connector.

I would think that an adjustment to the radio would better serve the purpose
then to place the whole radio at risk with running that high of voltage.

I just put my standard ICOM 706 in my Honda Accord.  I have powered it with the cigarette lighter.  I know I can't run a lot of power from this, but it seems to do CW on 40 meters at 20 or 30 watts with no problem.  Has anyone actually damaged the IC706 using the cigarette lighter?

Sincerely, Brock Winfrey

The specification for the 706 is 13.8V +/-15%. That means it should meet it's rated output from 11.73V to 15.87V. You're not even getting 100W at 13.6V, when you should be. Most often this will be a voltage drop in the power input but if that's not it you could have a component or alignment issue. Whether that extra dB and half is worth it to you to dig into the radio and find it is another matter.

Prove the DC levels first and go from there.

I wish I had a variable supply. I don't.
I don't think you'll get full power at 12v
At 12.5 I don't know. I think you said the mfj was 13.6. That should be sufficient. There has been talk before about resistance possible in the fuseholders and also with aftermarket power cords not having correct size pins. I doubt their is anything wrong with your radio.

You should get the full 100 watts out at 13.8 volts.  This may vary from about 90 to 110 watts.  The 13.8 volts is the standard input voltage used by almost all transceivers that are designed for what is called 12 volts. This is a reasonable value for most cars while the engine is running.  There may be a drop in voltage when transmitting.  This could be due to the power cable going to the 706.  There are several power adjustments inside the 706 for the differant bands.  They may be out of adjustment.

It may also be the wattmeter and antenna system.  If you do not have a dummy load or antenna that has a very low swr the transmitter will cut the power output back.  The wattmeter may not be very accurate.  I posted some tests about 6 months ago with several wattmeters and an Icom 746PRO to show how much diffeance there can be.

Because the spec is from 11.7 to 15.8 does not mean it will put out the full 100 watts at a lower voltage.

It measn the 706 will work in those voltage ranges with out harm.  You will get less power out at voltages below 13.8 and more above 13.8 volts.

I am not sure about all, but many have posted problems with transmitting if the voltage drops much below 12.5 volts.  It may be the power wires are dropping enough voltage so that the actual voltage inside the 706 is less than the 11.7 you calculated.

Interesting! I have seen several threads about adjusting the output from the factory settings to get the advertised 100 W.

My first observation would have been: Before making any adjustments it appears wise to first verify the proper supply voltage, then limit the output to 100 watts. Thereby protecting the finals and, also, getting the most out of them with the proper conditions.

Mark's findings refute that, providing the minimum required voltage is supplied.

I wonder if the variations that Rakesh noted may come from the ability of each of those power supplies to handle the amps demanded by the 706? I trust that the same antenna load was used on each test.

Curious minds want to know. =)

Yes, the antenna load is same, under all the test condx, a very well matched antenna with very low SWR 1:1...Freq. I am testing on is 14.200. What next I plan to do is that I will try hook same supplies with same DC cable etc to my another 706 radio and will see what output it gives... just to be sure if the radios are ok....and if I get full 100 watts out with 2nd 706 with same supply (MFJ 4125@13.60v) , it would mean that some thing wrong with my 1st 706....

Subject: Re: [ic706] 706 and power supply

Can you try shortening the power cord and/or increasing the gauge of the wire used in the power cord?

Are you using the stock ICOM cord for the 706?

You think that I should get full 100 watts with supply voltage from 12v to 13.8v

!!!

if I am not getting required power out put, that means- some thing wrong with: DC cable, DC power connector at the back of the radio, Fuse and Fuse holders, and if all this all is ok, some fault in my radio !!!!!????????

I don't know what the "official" test would be, but I'd consider connecting the power supply end (bare wire or terminals?) to a known voltage power supply, then putting a voltmeter on the positive and negative pins of the plug that mates with the rig. What reading do you get?

It is difficult to just test a power cord for voltage drop.  If there are only .2 ohms of resistance in bad connections at the fuse holders or terminals, it will not show up if you just hook a voltmeter to the power cord.  That same .2 ohms will drop a lot of voltage (compaired to the 13.8 volts) under a load of around 20 amps the 706 will draw while transmitting.  Most people can not measure resistance under 1 ohm very well.

I would start inside the 706 where the power wires connect to the printed circuit board.

YES you should!!!
Yes it sounds like a fault, could be in a fuse, cord, or connector, Could also be in the radio, I would un plug the connector at the radio and see what the voltage is there, it should be the same as the supply then take apart the fuse holders (turn off the supply first) and using a electronics cleaner or abrasive cloth clean the fuses connections and the holders next clean the connections to the radio put it all back together and see what the power out is (turn the voltage back down first to 13.4-8) if you get full power out you were limited because of current loss in the corrosion if not then you have a radio fault.
IF you do not have a good repair center where you are there are several here in the states as well as you can send it directly to ICOM for service.

# 18407. RE: EXTERNAL: Re: [ic706] 706 and power supply

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-16 22:40:26 UTC
From: Lefczik, Larry D
Topic: 18390  Message: 18407

From the Service Manual
Supply to Final Transistors Q171/Q172 is to be measured at 13.7 V.
Supply to the Driver Q100 is to be measured at 13.8 V.

MEASUREMENT CONDITIONS
SUPPLY VOLTAGE: 13.8 V
14.1 MHz USB
DIGITAL MULTIMETER: 50 k%/V

I see no voltage regulator between the Power Plug and these transistors, so what you supply is what the transistors get. Hence, a higher supply voltage leads to higher output power.

I don't know the absolute Max voltage the transistors can take, but I understand they are quite expensive to replace, so we try to keep our supply voltages within spec.

What people are saying about the power cable is there could be a voltage drop on a long cable since under full transmit power load if you have a 0.2 Ohm wire resistance for 3 feet and draw 20 Amps you could have a Voltage drop of (20A x 0.2 Ohms) = 4 Volts at the connector. This should be measured at the radio power connector with the radio at full transmit power. During receive when drawing less than an Amp you will not notice the (1 Amp x 0.2 Ohm) = 0.2 Volt drop.

You are taking the best approach, since you have another 706, by swapping radios and taking measurements. It will tell you if it is the radio or the power SYSTEM including supply cable and connectors. Per the manual, there is a HF power out adjustment so I would not be surprised at all if you get different power output readings for every radio you try.

Just to reinforce good troubleshooting techniques [and what has been said already, latest by Mark, N1UK].....place the suspect circuit under load then test for voltage drops, as the fault is much more apparent than chasing resistances through out the circuit.

Remember Ohms law, zero current flow will show the applied voltage.

# 18413. 706 and power supply

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-19 14:21:03 UTC
From: Rakesh Kapoor
Topic: 18390  Message: 18413

I did flowing tests today:
First with Power Supply: MFJ 4125 giving 13.6 v @ 22 A
Radio 1st IC 706MK2G and 2nd IC706MK2G
1st DC Cable (Original), 2nd Cable (Original) and 3rd (TS 50 cable)
Freq: 14.200
SWR 1:1.1
SWR meter Daiwa Cross needle type
OUT PUT on RTTY Mode= 65 watts ( with all 3 cables and @ 13.60v)

2nd Test All as above, only used : 1-Meanwell SMPS giving 14.ov and 2- PS 55..giving 14.85v..
OUT PUT= 100 watts

That means I need a supply which gives near 14.v to get full 100 watts out put from my two of IC706MK2Gs...

I have been doing some experiment using supply MFJ-4125, which gives 13.6v, and another supply that gives 14.06v. With MFJ- 4125, I got 65 watts out only. I did this test with two of my IC706MK2G and 3 different DC cables. But as I connect radios with a supply which gives 14v, I get full 100 watts.

After all these tests, I have come to this conclusion that my radio needs 14v to give full 100 watts output . This means that I will have to adjust out put voltage of my 4125 to near 14. v. You think I should do that???

NO I think you should repair the 706MIIG so that it puts out the 100watts at 13.6VDC that way you do not harm the radio with over voltage spikes or have to "mod" the power supply so that it is only good for one radio.

Dear Jeff Moore,
I tried 13.8. I have a 25A supply which is variable, from 12v to 14v, I tried 12v, 13v and 13.8 v. I get 65 watts out. But at 14v setting of the same supply, I get 100 watts. I tried this with different 3 DC cables....2 original Icom and one original of TS50s, but with same results, 65 watts out @ 13.60v.....

When are you going to try 13.8 vdc ?? That's what it's supposed to be although the radio should put out 100 watts over a range of voltages from 12.5 vdc up to 14 vdc.

Adjust your supply!

There's something not right the rig should not be that sensitive to such a minor voltage variation.

NO I think you should repair the 706MIIG so that it puts out the 100watts at 13.6VDC that way you do not harm the radio with over voltage spikes or have to "mod" the power supply so that it is only good for one radio.

BEFORE you do anything FOOLISH are you 100% certain/sure that your watt meter is 100% operating properly and well calibrated.

If both radios are showing the same response I would suspect the common item that is the power supply.

0.4 vdc should not make 35 watts difference in the output of the radio(s)! There's either something wrong with your radio(s) or your test setup.

Dear Dave,
My SWR/Watt meter is good and quite accurate. It is Diawa cross needle type. I check it with other HF radios and it shows proper output. So the Watt meter is OK. I will check voltage of the power supply with another multi-meter.

That being the case yea the radios to the power supply is bad! IF it can NOT put out 22amps at 13.6 Volts then it will also hold the power back as a test set a car battery at he test bench hook it to the 13.6 Volt supply charging it for 2 - 3 hours then add the radio to the battery, you should see the battery sitting at 13.6 - 13.8 volts to start with. Now test the out put of the radio and see if you get the full 100 watts out. IF you do the your supply DOES NOT have the currant capacity to power the radio and you need a better supply.

Adding voltage is NOT a good answer! that radio should put out 100 watts from 12.4 - 14.0 volts as this is nominal power in a car. and 14.0 volts all the time is NOT good for the radio and may cause early failure of the radio.

I feel like the problem is that mfj supply.
If it were not there- no problem.

Happy QSO'ing. Mike R

That being the case yea the radios to the power supply is bad! IF it can NOT put out 22amps at 13.6 Volts then it will also hold the power back as a test set a car battery at he test bench hook it to the 13.6 Volt supply charging it for 2 - 3 hours then add the radio to the battery, you should see the battery sitting at 13.6 - 13.8 volts to start with. Now test the out put of the radio and see if you get the full 100 watts out. IF you do the your supply DOES NOT have the currant capacity to power the radio and you need a better supply.

Adding voltage is NOT a good answer! that radio should put out 100 watts from 12.4 - 14.0 volts as this is nominal power in a car. and 14.0 volts all the time is NOT good for the radio and may cause early failure of the radio.

I am wondering, before we shoot the tester, can anyone else perform the same experiments and post his/their results?

I can understand the supply voltage affecting the output, but that is a large percentage change for a small voltage variation.

Rakesh-
I have lost track of your testing method.

What mode (FM, RTTY, SSB) are you using?

Are you watching the WATT meter while adjusting the supply or are you taking discrete samples?

What are you using to measure radio output power?

What are you using to measure supply voltage?

Etc...

NJ2L

# 18431. Re: EXTERNAL: Re: [ic706] ic706 and power supply

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-22 14:21:54 UTC
From: Rakesh Kapoor
Topic: 18415  Message: 18431

Dear NJ2L,
I am checking with supply MFJ-4125, which gives 13.6v. The watt meter is Daiwa cross-needle type, which is fairly accurate. I use same watt meter for my other HF radios and I see out put to antenna on this meter, which seems to be ok. I use digital multi meter to measure/read DC voltage from power supply.

Yesterday, I did a new test, I used same 2 power supplies, MFJ-4125@ 13.6v and other with 14.0v, and 2 DC cables, but this time, radio was not IC706mk2g, it was TS50, With this radio and applied DC voltage, which was, 13.60v and 14.0 , there was very little change in out put, I mean, I got same out put, 90 watts, with both supplies. But with 706, little increase in DC voltage ( from 13.6v to 14.0v) boosts output. from 65 to 100 watts only thing I am not doing is that I am not measuring Current being drawn by radio at full power.....
73.

Rakesh,

Have you discussed this with ICOM yet?

I'm sure their reply would be more useful than a list of suggestions from the group, however well intentioned.

Subject: RE: EXTERNAL: Re: [ic706] ic706 and power supply

I am wondering, before we shoot the tester, can anyone else perform the same

experiments and post his/their results?

I can understand the supply voltage affecting the output, but that is a
large
percentage change for a small voltage variation.

Rakesh-
I have lost track of your testing method.

What mode (FM, RTTY, SSB) are you using?

Are you watching the WATT meter while adjusting the supply or are you taking

discrete samples?

What are you using to measure radio output power?

What are you using to measure supply voltage?

Etc...

NJ2L

0.4 vdc should not make 35 watts difference in the output of the radio(s)!
There's either something wrong with your radio(s) or your test setup.

Dear Jack,
This is happening with both of my 706s... you mean I repair both the radios
!!!!!! as both give 65 watts @ 13.6v !!!!!! and 100 watts @ 14.00+ v....both

radios are almost new .....

NO I think you should repair the 706MIIG so that it puts out the 100watts at

13.6VDC that way you do not harm the radio with over voltage spikes or have
to "mod" the power supply so that it is only good for one radio.

No, but after a while of relying upon the listserve without resolution, you may reach the point of diminishing returns; then, as someone suggested, you may need to take the problem to those theoretically most capable of diagnosing and correcting the problem - an ICOM service center.

Also, the fellow's suggestion to connect the radio to a freshly and fully-charged car battery as a comparison to the AC-driven power supplies seemed to have merit.

I find it curious that two 706's did the same thing. This
to me says to look at the common elements, namely the power
supply already mentioned and something that I think is suspect,
and that is your RF load. I recall you mentioned it was an
antenna and it really needs to be resistive load, not only
to rule out any reactance but also common mode energy and possible
RF overload into your supply. Remove as many variables from your
test as possible. There's still not enough information to go on
to help isolate your problem.

As I said before I suspect that mfj supply.
If your 14.0 volt supply is a good regulated quality supply I would use it and put the mfj to use for miscelaneous purposes. I wouldn't worry any at all about 14.0 if that's what it is.

Happy QSO'ing. Mike R

From: SaTeLlItE
Topic: 18440  Message: 18440

For the life of me, can i get the 706 aligned! nope. sod all adjustments for VHF/UHF VCO alignments.

you have a 60.0000Mhz center frequency and thats it, with locking voltages..

Reason, my Mk2 G is 3Hz off , peed me off a bit on SSB VHF. On HF its spot on.

any one got any info regarding other radios like this, possible cures?

Nope cant be bothered with sending it to ICOM either. Seen a post back along.. came back the same.. I will just live with it.. Dial another 3Hz above!.. RX and TX kweel then..

Hey all, been down this road with the icom 706mk2g

Power to RF output. Seems like its a 706 thing.

let me explain, My Mk2 hits 100W just on 10Meters, 20Meters 125W. 40 meters 130W and 80 meters 140W.

Thats at 13.8Vdc.. and the PSU is a 35 amp switch mode , with the Icom Lead.

At 11.85VDC to emulate my car battery. 10 Meters 90W, 20 Meters 95W, 40 meters 105W. 80 meters 110W.

I get a good 100W on 6 Meters also..

BUT had to set up the radio to do this,

Page 63 in the user manual shows

430MHZ power adjust
144MHZ
50MHZ
HF power
AM tx carrier adj
These are the adjustment pots for TX power.

The 706 has a flaw. When u wind these pots up on 13.8VDC, at 12VDC the output power is alot lower u would need to turn the internal pots up to compensate. Just to bring the RF back up .

Also if u wind up the power, for 12VDC, when ur at 13.8VDC, the ICOM limits the power. The Set RF power menu setting gets to overdrive at the "H" and u have to back it off in the menu settings, or it will go past the " Too much drive"... point.

For some reason, the 706 drops the RF back, I think it has some sort of over voltage bias sence for the Finals..

PSU Switch mode, variable Voltage with Digital Meter.35 AMp Max, backed up with a DVM

50Ohm oil filled Bird dummy load
Avair SX600 SWR/Power meter.

Change the phase lock crystal in the 60,000,000 HZ circuit to a temperature controlled Cesium Beam standard. 3Hz out of 60,000,000 is one part in 20 million. Excellent for a crystal based system.

You should learn how to read specifications. The frequency accuracy is independent of frequency stability. Frequency stability, AKA drift, is dependent on power supply regulation, power supply ripple voltage, ambient temperature at the crystal, PLL gain versus temperature, closed loop gain stability versus voltage, closed loop gain versus temperature, component aging, component temperature variations, ... the list goes on.

Every frequency reference has an accuracy and a drift specification.

3HZ out of 60,000,000 HZ is extremely good. As I facetiously mentioned in the opening line, if you want the best accuracy and stability available then mortgage your home and purchase a Cesium Beam standard. But, when you use it inside a closed Phase Locked Loop, PLL, you lose the accuracy of the standard due to gain variations in the loop as a function of the loop aging and environment.

The CR-282 stabilized crystal will give an order of magnitude improvement in both accuracy and stability, if your frequency meter has accuracy and stability in the 10^9 th range so that you can get it on frequency to begin with.

Check the voltage at the radio. I've seen voltage drops through the DC cable when the in-line fuse holders start going bad (the fuse contacts start getting loose over time). I've always clipped out those louse cartridge fuse holders and replaced them with good automotive blade-type fuse holders.

You did not list the spectrum analyzer used to confirm signal purity when above the rated power that Icom used for alignment of your radio.

At the price of the final amplifier transistors, I don't know if the extra dB of signal is worth the risk.

Lotsa' good stuff and I concurr. 3 Hz is spectatular (assuming your frequency counter is more accurate than that by enough to measure that error. If it is 3 Hz off at 60M then it'll be a whopping 7.2 Hz off on 2! Oh the humanity!
Uh, Sorry for the humor....

However, I take issue with the following:

> But, when you use it inside a closed Phase Locked Loop, PLL, you lose the accuracy of the standard due to gain variations in the loop as a function of the loop aging and environment.

Actually, with true phase lock, which all modern designs are, the accuracy of the output of a PLL (in ppm) is equal to the reference. When you lock phase there can be no frequency error. For a frequency error to occur there must be a constant phase slip (not just a constant phase error, which *may* be allowed). Modern phase detectors don't allow that. They are type II or above (with the addition of additional integration). (I designed PLL synthesizers).
Also, the fine frequency steps are done with DDS techniques which also insure phase lock. Fractional N, if used, but I doubt it, is phase locked as well.

Then:
> The CR-282 stabilized crystal will give an order of magnitude improvement in both accuracy and stability, if your frequency meter has accuracy and stability in the 10^9 th range so that you can get it on frequency to begin with.

True, just remember that a heated crystal has a warm-up time and will start quite high in frequency until the crystal gets to temperature. Therefore, they have much more warm-up drift than a non ovenized crystal, which will have little. An AT cut for an oven at about 60 Deg C will have 6-7 ppm drift downward during warm-up. That's 864 to 1008 Hz warm up drift. I do not know what temp the CR-282 runs at.

73, Steve, K9DCI

# 18448. Re: 706, power supply and Pout

Yahoo group: ic706 (2010 — 2015)

From: noskosteve
Topic: 18385  Message: 18448

Several answers.

Mike R.
If you have to go down to 5W to eliminate distortion, you may have RF in the shack (radio/mic).

Hi Rakesh,

You're not wrong to ask questions, but you must realize that most hams aren't repair technicians, or engineers and haven't designed transceivers and can only tell what they learned from others -- whether it is well founded and correct or not.

While it may seem that you should expect 100 Watts out of your transmitter, you must be willing to accept less than ideal performance. Expecting 100 watts regardless of supply voltage is unreasonable.

My initial though, from what you describe, is: I wonder if you *really* have a problem....Though 65 W on CW does sound low, it's the only thing I see in your original post.

Factors you (and others) must consider.

1 - If you are measuring the power supply voltage *under Load* then the power supply almost CANNOT be causing trouble. Unless ...there is some ripple or strange oscillation that averages out to the measured DC voltage, yet is driving the power control loop 706 crazy. [I disagree with Mike R.]

2 - Manufacturers specify output at some input voltage, but they may not say *where* it is measured. It could be measured at the radio's connector. It MAY NOT be as you expect, at the far end of the power cable. You don't say *where* you measure it and I don't know where Icom specs it.

3 - Radios *WILL* vary in power with supply voltage. You absolutely cannot expect 100 Watts all the time regardless of supply voltage. If the radio has a power control loop, it can keep it closer, but not exact and not as the voltage drops. See #2 & #4

4 - The accuracy of the watt meter. It really up to it's spec?

4 - Variations of 25 % in power, though seemingly large, are only ONE dB. Not enough to be concerned about, or notice, in the real world. Radio designers know this and don't want to put more cost into the radio when the Amateur is so cost sensitive. I designed for Motorola and it takes $$ to get high quality performance under all conditions all the time and for a long time... LOTS of $$.

5 - A fully charged car battery for a reference to measure power is only a little over 12 volts, not the spec'd 13.8. See #3.

6 - If two radios show the same characteristic, one conclusion could be the power source, HOWEVER, another could be simply the radio's design behaves that way. See #4

7 - No, SaTeLlItE, you don't turn the power up with 12 V on the radio. You only set the power with 13.8 at the point Icom specifies to measure it. Then you take the variations with supply voltage that occur.

Finally, I'm not sure what you are looking for in an answer. My recommendation is to try contacting Icom or, perhaps AES repair to see if this is normal behavior or looks like a true problem.

You guys, what do you lot live on? Not the same air as me, iam sure!..

Right, so u think i am thick as shit!..

How do i spell this out!.. THE RADIO IS OFF FREQUENCY! ITS NOT MEANT TO BE.

The VHF and UHF is 3Hz off. this means when on LSB/USB i have to dial 3Hz higher. You dont notice it on FM/AM.

HF is perfect. Spot/BANG on freq. Shall i say that again!..

If i dial in 144.300.3 then the radio is actually on 144.300. And yes my Freq counter is right..backed up my on air QSO`s also.

SO for the second time.. iam asking, WHY?..

The service manual has no mention of alignment on the VCO frequency, for VHF/UHF.. except the main occilator at 60MHZ.. which by the way COVERS ALL THE RADIO.

Usefull posts please!..

You must be thick as something if you don't know the difference between
3 Hz and 300 Hz. It seems you did a pretty good job of describing yourself.

Well, I'm going to add some here. Hopefully calmer attitudes can prevail...

As was already said, you posted apparently inaccurate information about the symptom. 3 Hz error on VHF is nothing, and I was quite surprised someone would post about that. I can tell that much error by ear on SSB (I can hear the phase shifting), but most folks can't. I was about to give you kudos for being able to. However, your last post is stating a 300 Hz error, which is quite significant, and an entirely different situation. You're lashing out at the folks here telling you the rig is fine at 3 Hz error on VHF, and it would be. Now you're describing a 300 Hz error. Totally different story. That would equate to a 30 Hz error on 20m, which is probably something you CAN align, and may NOT notice if people aren't on top of it. I suggest you get on WWV and tweak the master oscillator until you can't hear a difference between USB & LSB when tuned to xx.000.000 on the display (try to use 15 MHz WWV feed -- it will get your adjustment closer than using 5 or 10 MHz). That's one method. I prefer using two receivers, one on AM listening to WWV, and the radio getting aligned on SSB tuned to the same WWV signal (have both about the same volume on speakers, not headphones). Now adjust the oscillator until the two receivers are EXACTLY zero beat. Also, let the rig completely warm up before adjusting. From that point on, you should be VERY close to dead-on frequency...

As I mentioned, I'm very particular with my freq tuning when I'm on SSB, so I keep my rigs very close to zero-beat with WWV. I'm not one of those ".000" guys -- I tune by ear, not by the numbers on the display...

Joe, N3JI

SEND IT TO ICOM FOR ADJUSTMENT! I have read all your posts! you are an appliance operator and should not be allowed to open the cover EVER have someone with the knowledge and experience work on the radio. 3hz is not worth the time 300 Hz is. if your hearing is that sensitive and you are that worried about the LAST digit being spot on but I will tell you that MOST people are not going to worry or care about 3hz.

Joe I hit a few of these, but ity took me all day, with family here, to put this rtogether....

Here's a Very "useful" post.

--- "SaTeLlItE" wrote:
> How do i spell this out!.. THE RADIO IS OFF FREQUENCY! ITS NOT MEANT TO BE.

YOU'RE the one who said it is only 3 Hz off:
""""""" >> The VHF and UHF is 3Hz off. this means when on LSB/USB i have to dial 3Hz higher. You dont notice it on FM/AM. << """""""

Read my lips. That is ON FREQ by any appropriate measure! DONE! and I could stop here, but...

OK. So you made a mistake. Isn't it natural for us to look for other potential mistakes first -- so we aren't chasing bad data to solve a non-existent problem? ... of course. Even if you had it correct at first we'd still do the same thing to make sure all is in order. Measurements are not trivial, in spite of what some may think.

DOWN TO BUSINESS... What *is* it "meant to be".

> SO for the second time.. iam asking, WHY?..

> If i dial in 144.300.3 then the radio is actually on 144.300.

SO... Your Radio's frequency is 300 HZ low on 2 meters with respect to someone else on 2 meters. This is 2.08 ppm. The radio has a spec of +/- 5 PPM, so this is WITHIN SPEC and is NOT a problem. 5 ppm is +/- 720 Hz.

That is what it is "...MEANT TO BE.". Read my lips. That is *also* ON FREQ by any appropriate measure. DONE! and I could also stop here, but...

HOWEVER.

If you want to set it closer, go ahead, but keep in mind that Icom has a warm up spec.
It can drift up to 7ppm in the first 60 minutes, or on 2 meters this is 1,000 Hz (1 kHz.). After that, on 2 meters, it can drift up to about 144 Hz per hour. This shouldn't continue forever, but it can drift around a little as the radio heats and cools. Crystals *DO* move around in frequency. They are *NOT* absolutely stable. If you want to see a temperature curves for the commonly used crystals, let me know.
Depending on the temperature the master oscillator is at, it can then vary by those same 5ppm or 720 Hz. From freezing to 50C or 122F. It does, however, follow a predictable frequency vs. temperature curve.

So ...you must let it warm up THEN set it. With a calibrated frequency counter you must use AM or FM to measure carrier frequency. OR you can zero beat WWV in SSB by using the "switching between USB and LSB" method.

Now. On to HF:
This would only be 30 HZ on 20 meters
This would only be 15 Hz on 40 meters
This would be only 7.5 Hz on 7

You say:
> HF is perfect. Spot/BANG on freq. Shall i say that again!

Can you tell 30 Hz error on SSB? I 'probably' tell the 30 Hz., but much less. Many hams I hear are 50 to 100 Hz. apart and sometimes more, in one QSO on HF.

A - HOW do you measure the "Spot-on" on "HF" ?? Is this with the freq counter? What is the Freq counter? Less expensive frequency counters *could* be less accurate higher in freq if the gating is not well done. I've seen this. See "D". Using others on the air is only a fair way to do it. If you are on Sideband, it depends on how you tune it in.

> And yes my Freq counter is right..backed up my on air QSO`s also.

B - What do you mean by this? How close it it? 1PPM, 0.1ppm, 0.01 ppm.? Have you calibrated, or checked, the frequency counter, say, against WWV? If you have you should be able to say how close it is.

C - How *Many* 'on air' radios was this checked against...more than one? If only one, how do you know *that* radio is not off, rather than you.

D - Have you checked the radio against WWV and if you have, what method do you use to determine zero beat? Modern radios are not simple to get true zero beat. REMEMBER that frequency counters also have a crystal as the reference...

E - If it is 300 Hz off on 2 meters, HOW far off is it in 440? It should be 900 Hz.

All these questions have an answer. They can help to identify what, if any, the problem is.

> The service manual has no mention of alignment on the VCO frequency, for VHF/UHF.. except the main occilator at 60MHZ.. which by the way COVERS ALL THE RADIO.

You answered your own question here. The master oscillator "COVERS ALL THE RADIO". Set it and all bands are on.

BTW: My "lot" is 36+ years as a radio development engineer with lab equipment that gets calibrated every year as well as a Navy electronics technician. I now use some HP equipment. I can check my HP counter against WWV among other things.

> Usefull posts please!..

# 18456. CW Setup problem

Yahoo group: ic706 (2010 — 2015)
Date: 2010-11-27 19:26:26 UTC
From: Dan
Topic: 18456  Message: 18456

Just obtained a 706MKII model and after resetting the microprocessor to put it in a known initial state I cannot get cw to work. Voice, ssb etc is alright. When I key the radio, with either a straight key or an automatic keyer the radio goes immediately into reset mode. It acts like I just turned it on again. I have set the cw setups to straight key and etc. Any hints or ideas? I have tried this with high and low power, several different bands, double checked settings also. A friend said it could be a VOX parameter but I check that also.

From: Ken Winterling
Topic: 18456  Message: 18457

Dan,

If the front panel blanks out when you press the CW key it might be the power cord connector at the radio and/or the fuse holders in the power cord. Both are know to cause trouble. The terminals in the connector become loose and will not support the heavy current drain. They can be carefully squeezed a tiny bit with fine long nose pliers. The same goes for the clips in the fuse holders. Remove the fuses and clean their ends. Slightly snug up the clips and reconnect them to the fuses.

Another possibility is the power supply. Since you say you just obtained the rig are you sure your power supply can produce at least 20A? If it can't it will go into overload and shut down until the load is removed. Another possibility is RF getting into the power supply and shutting it down especially if you are not performing your tests using a dummy load.

Good luck and let us know what you find!

Ken, WA2LBI

From: RAYMOND J
Topic: 18458  Message: 18458

hi
i am having some bad luck here lately...the power switch on mkIIg took a dump{the micro spring went bad}and all the radio would do is turn itself off as soon as it started too turn on.....
so i took the head apart took the switch apart and imediatly lost the spring.....
so i found a carbon button and super glued it to the pc board and the switch worked just fine.....
but now the vfo knob will not function...anybody else here knowwhats going on please tell me what to loo for....

# 18459. Y adaptor for Mk2

Yahoo group: ic706 (2010 — 2015)
Date: 2010-12-06 19:02:21 UTC
From: Ian
Topic: 18459  Message: 18459

Hi

Was wondering if there is a 'Y' adaptor to fit into the 13 pin accessory socket which provides 2 13 pin sockets?

I'm getting a tigertronic signallink with the 13 pin adaptor, but I have the at-180 ATU plugged into the back of the radio. So I was thinking how do I attach both at the same time. I know there is the OPC-599 adaptor but that give a 8 pin and a 7 pin din connectors.

So how do I do it?

Have you done it,

Cheers

Ian

I had a similar problem with something else (sorry - I can't remember what); I called Icom and they said "just use the other jack on the tuner", and it worked!

From: steve
Topic: 18461  Message: 18462

Hello all,

I want to add a preamp to help my receive on 2 meters-mainly for SSB work. Where would be a good place to disconnect the receive line to interface a preamp? Also, any suggestions for a good preamp? I have an ARR Mosfet or an ARR Gasfet that I can use. I am not sure I can put it internally. I may have to run it outside the case.

Thanks

Steve W4YJ (ex W4SEF)

Hi Al

OK, knew that there was 2 13 pin and 1 7 pin socket on the back of the tuner, but unsure if they are designed for the likes of a signallink data terminal. Do'nt think that the data will travel to the radio then back to the tuner then out to the antenna somehow, but you never know.

Cheers

Ian

Actually the diff between 144,300.3 and 144,300 is 0.3 kHz (300 Hz), not 3 Hz.

Not EASILY done, but why not make your own? Not much room to work on the connectors, so I'd recommend truly making up a 'Y' with the 3 ends coming to a terminal board or splice connections.

Where you guys been ? This has all been covered. (;-)
See msg 18454:

Re: 3HZ VHF UHF off frequency

Joe I. hit a few of these, but ity took me all day, with family here, to put this together....

Here's a Very "useful" post.

--- "SaTeLlItE" wrote:
> How do i spell this out!.. THE RADIO IS OFF FREQUENCY! ITS NOT MEANT TO BE.

YOU'RE the one who said it is only 3 Hz off:
""""""" >> The VHF and UHF is 3Hz off. this means when on LSB/USB i have to dial 3Hz higher. You dont notice it on FM/AM. << """""""

Read my lips. That is ON FREQ by any appropriate measure! DONE! and I could stop here, but...

OK. So you made a mistake. Isn't it natural for us to look for other potential mistakes first -- so we aren't chasing bad data to solve a non-existent problem? ... of course. Even if you had it correct at first we'd still do the same thing to make sure all is in order. Measurements are not trivial, in spite of what some may think.

DOWN TO BUSINESS... What *is* it "meant to be".

> SO for the second time.. iam asking, WHY?..

> If i dial in 144.300.3 then the radio is actually on 144.300.

SO... Your Radio's frequency is 300 HZ low on 2 meters with respect to someone else on 2 meters. This is 2.08 ppm. The radio has a spec of +/- 5 PPM, so this is WITHIN SPEC and is NOT a problem. 5 ppm is +/- 720 Hz.

That is what it is "...MEANT TO BE.". Read my lips. That is *also* ON FREQ by any appropriate measure. DONE! and I could also stop here, but...

HOWEVER.

If you want to set it closer, go ahead, but keep in mind that Icom has a warm up spec. It can drift up to 7ppm in the first 60 minutes, or on 2 meters this is 1,000 Hz (1 kHz.). After that, on 2 meters, it can drift up to about 144 Hz per hour. This shouldn't continue forever, but it can drift around a little as the radio heats and cools. Crystals *DO* move around in frequency. They are *NOT* absolutely stable. If you want to see a temperature curves for the commonly used crystals, let me know.
Depending on the temperature the master oscillator is at, it can then vary by those same 5ppm or 720 Hz. From freezing to 50C or 122F. It does, however, follow a predictable frequency vs. temperature curve.

So ...you must let it warm up THEN set it. With a calibrated frequency counter you must use AM or FM to measure carrier frequency. OR you can zero beat WWV in SSB by using the "switching between USB and LSB" method.

Now. On to HF:
This would only be 30 HZ on 20 meters
This would only be 15 Hz on 40 meters
This would be only 7.5 Hz on 7

You say:
> HF is perfect. Spot/BANG on freq. Shall i say that again!

Can you tell 30 Hz error on SSB? I 'probably' tell the 30 Hz., but much less. Many hams I hear are 50 to 100 Hz. apart and sometimes more, in one QSO on HF.

A - HOW do you measure the "Spot-on" on "HF" ?? Is this with the freq counter? What is the Freq counter? Less expensive frequency counters *could* be less accurate higher in freq if the gating is not well done. I've seen this. See "D". Using others on the air is only a fair way to do it. If you are on Sideband, it depends on how you tune it in.

> And yes my Freq counter is right..backed up my on air QSO`s also.

B - What do you mean by this? How close it it? 1PPM, 0.1ppm, 0.01 ppm.? Have you calibrated, or checked, the frequency counter, say, against WWV? If you have you should be able to say how close it is.

C - How *Many* 'on air' radios was this checked against...more than one? If only one, how do you know *that* radio is not off, rather than you.

D - Have you checked the radio against WWV and if you have, what method do you use to determine zero beat? Modern radios are not simple to get true zero beat. REMEMBER that frequency counters also have a crystal as the reference...

E - If it is 300 Hz off on 2 meters, HOW far off is it in 440? It should be 900 Hz.

All these questions have an answer. They can help to identify what, if any, the problem is.

> The service manual has no mention of alignment on the VCO frequency, for VHF/UHF.. except the main occilator at 60MHZ.. which by the way COVERS ALL THE RADIO.

You answered your own question here. The master oscillator "COVERS ALL THE RADIO". Set it and all bands are on.

BTW: My "lot" is 36+ years as a radio development engineer with lab equipment that gets calibrated every year as well as a Navy electronics technician. I now use some HP

equipment. I can check my HP counter against WWV among other things.

> Usefull posts please!..
Was this useful enough??

My first question is what counter are you using? Unless you have the counter time base tied to either a GPS or rubidium standard it cannot be accurate to 3Hz at 144MHz- that is 0.02 PPM- well beyond the capabilities of even my Agilent 53132A- and that's a $4K counter. Just because your counter has the resolution to display 3Hz at 144MHz does not mean that that digit (or the 2 before it) are accurate. That's the difference between resolution and accuracy- and also, I might say WAY better than the specs of the IC-706. On top of that you have to look at the stability characteristics of the 706:

---
Frequency stability Less than ? 7ppm from 1 min. to 60 min. after power ON. After that rate of stability less than ? 1 ppm/hr. at +25 ?C (+77?F). Temperature fluctuations 0?C to +50?C (+32?F to +122?F) less than ?5 ppm.

7PPM equates to 1008Hz at 144MHz.

Next we look at the CR282 high stability TCXO. It spec at 0.5PPM- that's +/- 72 Hz at 144MHz.

So, bottom line is, even if you have a counter that can accurately measure 3Hz at 144MHz (not resolve, but measure), this demand is way beyond the capabilities of the IC-706- any flavor.

I suspect that you are 100% correct in the lack of understanding of the difference between accuracy and resolution.

I made the same case about one month ago when this thread started.

I suggest we all let this thread die a second time.

From: Greg
Topic: 18440  Message: 18474

I hesitated to insert my two cents worth as I am not always the 'brightest bulb in the pack', especially with a problem of this nature. But the solution is pretty obvious to me. If the radio does not perform to your satisfaction THEN GET ONE THAT DOES!!! END OF STORY.

Many times I have bought items, not only inexpensive ones either, that did not do what I thought they should, so they either were fixed or out they go. Life is hard enough without making it overly difficult.

Now, let's all return to our daily net.....

73's all.

What I have done here is to use the OPC-599 and a 8 pin cable from Signalink, my amp is controlled by a 7 pin cable, both standard Icom cables as used on radios with both ports. Just remember to disconnect the microphone or all the shack noises wil go out with the digital :-)

73,
Bob N3PPH

From: powerguy480
Topic: 18440  Message: 18476

Shhhhheeeeesh! The guy's radio is off by 300 Hz not 3Hz. 144,300,300Hz is 300Hz NOT 3Hz. Now on SSB there will be a noticeable pitch difference. Now as for what to do about it? Sounds like a job for ICOM. Another question: Is it 300Hz off on all frequencies?

From: Ian
Topic: 18459  Message: 18478

Thanks to all who took the time to reply.

So what has transpired...

Well the Signalink unit arrived, which was configured as per their instructions. I then plugged the 13 pin din acc socket into the back of the AT-180, using the spare socket, the other being the link from the rig to the ATU.

And last night I managed to make 2 psk contacts with it.

So it appears that the signals go from the atu back to the rig and out the antenna socket.

So here's hoping I don't damage anything..

Cheers

Ian

# 18479. Stuck in reset

Yahoo group: ic706 (2010 — 2015)
Date: 2010-12-14 16:48:00 UTC
From: ve3bv
Topic: 18479  Message: 18479

hi folks..heres the problem..when unit is powered up it reverts to "cpu" reset ..The up /down band buttons don't work BUT the key beep works. I can spin it up to whatever band and get it to work in all modes BUT. power off back to "cpu" reset mode. I do have a service "pdf manual" but is hard to read..If I knew some of the ribbon cable voltages I could nail it down better .any help would be welcome.
Just getting over major surgery and I am getting my shack back on line.

thanks
bruce ve3bv / ve3aay

From: Ron
Topic: 18482  Message: 18482

Good Day All...I've got an old MkIIg (#21033) with the famous 15/17 meter oscillation failure. Over the years I've had it repaired multiple times, but no repair has lasted more than 3 weeks. Last week I decided to try again on 17m (my favorite band), so I disassembled it and did the loosen/tighten on all the screws. (It's had all the mods/tweaks done already) Used the analyzer to tune up 17m on my antenna, connected it up and keyed up CW at output 3 to check the swr on the rigs' meter. It showed just a bit higher than analyzer, which is normal, so I keyed again and fine tuned the tuner to bring it down to 1.1:1. Set it back to USB and called CQ. ZIPPO, no modulation, no alc on the meter, and no response! I thought I'd blown the finals, but I do have @ high power, 13 watts out on CW. I hooked up my old ICF-2010, and I could hear myself with RF gain turned all the way down and NO antenna. So it's transmitting, barely! For the heck of it I tried it on VHF, and that's as screwed up as the HF, so it's not the finals. I did a full reset of the radio, and that didn't do anything but kill my memories!! Any suggestions on where to look, or what to look for??? TNX in Advance...

Ron,

I had a similar issue with my rig. Turned out being the microphone jack/plug connection.

After fooling with it for a day or so I finally bit the bullet, cut it off and replaced it. With that the problem went away and has not returned, it's been several months now.

I never bothered to research just why a poor connector/connection at that point would cause an issue but I suspect that it was a cross-short of some sort as opposed to an open, I found some frayed wires inside the removed plug that could have been shorting. The position of the jack lends it to damage and abuse. I have since installed a strain-relief next to the jack, similar to a commercial Motorola microphone jack.

Good Luck!

73,

Dave S.

Dave,

I have just uploaded a photo of my G model mic RJ45 into the misc photo folder http://tinyurl.com/37cvw2x , it shows
1 - Blank
2 - Black
3 - Blank
4 - Green
5 - Brown
6 - White
7 - Blue
8 - Blank

Page 8 of the manual gives details (pin 1 has the +8V on it).

# 18493. Meter with Strange behavior

Yahoo group: ic706 (2010 — 2015)
Date: 2010-12-25 19:07:03 UTC
From: Jan Erichsen
Topic: 18493  Message: 18493

He,
I have a Ic-706MkII in the car with an AH-4 tuner. The radio is behaving a little strange. When I press the tune button, the tuner tunes for about 2 sec. When I select SWR on the "MET" button to check the SWR, it shows e 5:1 SWR, I understand nothing, but I tried a QSO and got 59 back, so I think the radio is OK. If I select "PO" with MET button, the meter shows about 3 watts out. If I select the SWR , the meter shows SWR 5:1. It looks like SWR on the meter shows output, and the PO on the meter shows SWR.. Just the opposite of what it should. Have others experienced this, or can provide an explanation.

Thank you

73

Hi! Sorry for the delay. Almost missed this.
The clip slips in intuitively. Nothing special. Zooming in on the pdf manual will show any unclear detail.

If you have a chance, order yourself a second set as the clip was only a few bucks. Add an extra buck if the spring is missing. If you don't use it, in a dozen years you could make a ham happy by having an extra one as the 703 and 706 will be around for another 30 years plus.

My guess is for some reason a 5:1 swr is best your getting and because of the 5:1 it's folding back power.
If you have a dummy load or good match you should see the meter functions behaving normally.

I saw it on the radio!

I have a Ic-706MkII in the car with an AH-4 tuner. The radio is behaving a little strange. When I press the tune button, the tuner tunes for about 2 sec. When I select SWR on the "MET" button to check the SWR, it shows e 5:1 SWR, I understand nothing, but I tried a QSO and got 59 back, so I think the radio is OK. If I select "PO" with MET button, the meter shows about 3 watts out. If I select the SWR , the meter shows SWR 5:1. It looks like SWR on the meter shows output, and the PO on the meter shows SWR.. Just the opposite of what it should. Have others experienced this, or can provide an explanation.

Thank you

For the moment I’m holidaying in the Norwegian mountains, -16F, and no dummy load. I’m using Watson monoband antennas.

I’ll have to do the testing when I arrives back home next year.

My guess is for some reason a 5:1 swr is best your getting and because of the 5:1 it's folding back power.
If you have a dummy load or good match you should see the meter functions behaving normally.

I saw it on the radio!

Happy QSO'ing. Mike R

If you've got a Watson for 10, it should provide a pretty good match if you've used it before. Should tell that the meters working correctly. Even 12,15, or 20 ones.
Strange thinks can happen with 40& 75/80.

I saw it on the radio!

RF into the radio ??

To test this: Try moving cables around and sliding hands over power cable and antenna cable.

Steve,

I have the display on the dashboard, and the radio and the AH-4 in a Tupperware box in the boot,

I removed the tuner , and put it outside the box, and that was the solution on the problem. The rig works as it should.

Thanks for the tip.

Seems like the problem was very low output on all bands. I assume the transmit is coming on. It would be pretty odd I think that it's VHF and hf. The newer models use seperate pa's so it's probally something ahead of that. You might check the menus for something out of order and try doing a reset. I forget what the fuse under the cover is for but check that too.

I saw it on the radio!

Happy QSO'ing. Mike R

What is it exactly you have for sale?

Have you tried cleaning the contacts on the control head and the contacts on the main body of the rig where they meet?

DeoxIT works wonders if the contacts have oxidized a bit, causing intermittent contact. Many 706s had numerous symptoms which were cured by cleaning those contacts.

I went back and looked at your original message. I suspect that the reason you didn't get any response is that most of us have never taken the control head apart so we can't be very useful in trying to figure out what you did when you took yours apart.

Save up your money, it can't be that expensive to get it repaired. Another option, probably not as cheap as just getting it repaired would be to try and find another control head from a defunct rf deck.

# 18513. DC power cycling problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-01-03 03:13:19 UTC
From: kf6aj
Topic: 18513  Message: 18513

To the group;

I own a 706MKII that has been misbehaving in the past year. The unit powers down and then comes back on when I transmit in SSB ☐ 1.8 to 50MHz only. The VHF FM operation is OK. Looks as if the problem goes away if I reduce the transmit power to level 7. The problem occurs in the car (battery power) as well as on the bench (15A DC supply). The bench power cord has no fuses and measuring the voltage at the internal 4A fuse shows the voltage is still there even though the power down mode happens. Another symptom, the internal relay does click off during a recycle mode.

Please advise if there is fix.

Does the problem occur with the engine running and connected to the battery? The 15a supply may not be enough. Sounds like a typical starvation problem with the 706.

I saw it on the radio!

I had the same problems with mine a couple of months ago (message#18329).

It was several cold/broken soldering on the PLL board. They are very hard to see. You have to use a magnifying glass

Are you using the separation kit? If so, try putting an RF Choke (ferrite bead with a couple of loops of cable) at each end of the separation cable. Next to the radio and next to the control head connection.

Hope this helps.

13.8 VDC @ 22 Amperes are the specified conditions for full power; not 12 VDC @ 15 amperes.

Start by beefing up your power source[s]

The typical "20 amp" supply is not good for 20 amps continuously. More like 16-17 amps if you are lucky. Maybe only 15 amps. The 20 amp name on the power supply is referring to short duration peaks. It is a marketing ploy to make you think you are getting something you are not. Your 15 amp bench supply is probably good for about 13 amps at most continuously. You actually need a 25 or 30 amp supply to get the full output with a safety margin.

# 18519. Re: [ic706] DC power cycling problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-01-04 20:01:18 UTC
From: A Wallace
Topic: 18513  Message: 18519

Bob's comment reminded me of the need to exercise caution when buying power supplies......

I recently bought, on sale, a small supply I intended to use for charging RC batteries....The box is marked as a "4 amp Peak Regulated" Supply.
Then in smaller writing printed on the supply it says "Total current 3A @ 50% duty cycle" with no indication of what time period the duty cycle should be. (I hadn't noticed that at the time)
So I set it charging a lipo battery at 2A. Within 1/2 hour, it had thermally shut down.
I finally found that it was capable of about 1A continuous! Yet the normal price for this unit was (and still is) $89. A wall wart can do that, and at much less cost.
It is not until I opened the box after purchase that I read the instructions which state that "Total Peak Current (10% Duty Cycle) 4 Amps". Next column is "Total continuous current @ 13.8V 1.5A"
There is a large number printed on the supplies, 4 (mine), 7 and 11, inferring that that is the current rating at a quick glance. The 11A supply is actually 5A continuous, and is around $180.

So check the detail before parting with your cash and ensure that it will do the job.

Cheers,
Adrian VK5AW

I am looking for a cheap/simple way to interface an Icom 706 series radio.
Will running a cable between the line out jack on a soundcard and the mic
jack on the 706, and then using VOX on the 706, produce acceptable audio?
Or is a more complicated interface needed?

It shoud, just be aware of things like:

DC on the mic input for the electret (I don't recall if 706 has this).

Ground issues commonly called ground lop. THis is a difference between the radio ground and computer ground. A 1:1 or even swtep down audio transformwe will eliminate this possibility.

Then Very carefully watch the level.

It's almost exactly what I'm using without problem. Cables are 3ft long.
I added a small SMD pot inside the mini connectors of the cables on the
computer side so I can tweek the levels. The radio output is -20 and the laptop
input is mic level. The radio input level was able to take the headphone out of
the laptop. I added the pot to the mini connector of the line out cable of the
laptop anyway.

btw, for ~$20USD, one can purchase the RS232 computer interface cable off of
ebay to get computer control of the radio. It's cheaper then constructing your
own. (unlike the audio interface)

# 18524. RE: EXTERNAL: Re: [ic706] Simple digital interface question

Yahoo group: ic706 (2010 — 2015)
Date: 2011-01-05 13:47:24 UTC
From: Lefczik, Larry D
Topic: 18520  Message: 18524

The cheapest way is acoustic coupling between the mic and speakers and using a locking PTT switch or footswitch. I have done this many times and made many contacts. Jus beware of background noise in the shack.

Second cheapest and probably more consistent is direct cabling with a small pot and 0.1 uF cap in the 706 mic line.

I use a CAT-5 patch chord and add the computer connectors to the end. Yes, hum is a theoretical possibility, but I am only using 2-3 feet of cable. And, I wire the pot with the fixed resistance on the computer output side and the capacitor on the 706 mic side. Since you can use a lot of attenuation here, the input to the 706 is close to ground (low-Z) and this reduces any hum. Turn off the 706 Compressor BTW. When I get things setup right, I use the 706 VOX for keying. It's just like using IM on the Internet.

For audio from the 706 to computer, I just use a mini to mini cable (I don't think it is shielded). Make a rough adjustment of the level into the computer with the Windows Mixer and fine tune with the 706 volume control.

Simple and Ham-like.

I have used this for home and Field Day. For PSK, SSTV and set up the computer as a Voice Keyer to call CQ-Contest.

Save your money and enjoy one of the few simple projects in left in Ham radio.

Subject: EXTERNAL: Re: [ic706] Simple digital interface question

It's almost exactly what I'm using without problem. Cables are 3ft long.
I added a small SMD pot inside the mini connectors of the cables on the
computer side so I can tweek the levels. The radio output is -20 and the laptop
input is mic level. The radio input level was able to take the headphone out of
the laptop. I added the pot to the mini connector of the line out cable of the
laptop anyway.

btw, for ~$20USD, one can purchase the RS232 computer interface cable off of
ebay to get computer control of the radio. It's cheaper then constructing your
own. (unlike the audio interface)

# 18525. For trade: Yaesu FT450 HF/6m radio

Yahoo group: ic706 (2010 — 2015)
Date: 2011-01-05 15:29:23 UTC
From: John Geiger
Topic: 18525  Message: 18525

I have an excellent condition Yaesu FT450 HF/6m radio for trade. The FT450 has it all-IF DSP so no extra filters are needed, a built in voice keyer, a built in CW memory keyer, a TCXO for increased stability, and a built in voice synthesizer to announce what frequency and mode you are on at the push of a button. In other words, this radio does it all.

It does 100 watts on HF and 6m, all modes.
It comes with the power cord, mic, manual, and original box. I am looking to trade it for an Icom 706 original or 706MKIIG, or maybe an Icom 820, or Kenwood TM255A

# 18526. Re: DC power cycling problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-01-06 02:30:58 UTC
From: dr_telecom
Topic: 18513  Message: 18526

1) If it happens both in the car and on the bench (into a dummy load) you got a radio problem

2)You are playing with fire if you have no fuses in your bench supply. Why? A short in the radio and it might be toast. A $800 radio turned to instant trash.

3) A 15a supply is incapable of running this radio on transmit. It pulls more than 20a at full power. (which is why i is probably shutting down - and your power supply is folding back to protect itself).

4) You likely have an RF feedback problem in the car. If you are using the separation kit...first be sure your radio is GROUNDED. The Mark II is very very fussy about that.

Second, be sure the screw in the connector for the separation kit is installed and tightened.

Run the radio in the car into a dummy load. If it works, you found the problem. Add RF chokes

If it doesn't , you either have too low voltage to the radio on transmit, or a bad radio. I hope you ran the wires for the radio directly to the battery with a fuse in both the + and - leads.

If you have RF feedback, and your radio is grounded and the base of your antenna is grounded, and you have sufficient voltage at the radio.....you need more chokes.

THe fact that it works OK at power level 7 seems to indicate you have a voltage problem in BOTH the car and on the bench.

You might also check to be sure the radio is NOT putting out more than 100w. (Some idiots crank the power all the way up to 150W plus and radiate all sorts of crud by doing so - makes them feel like they have a 'big signal' but all the power is generating sideband splatter)

In VHF, the radio only runs 50w or so. (less current draw).

I should have put this in my last reply. But oh well. I use the Signalink USB interface. They now have rig specific cable and jumper module. Simple as plug it in and set your audio in and out levels. Turn on your VOX on the Icom and it will even key up the rig.

Why not just make up a cable to plug into the DIN connector on the back of the radio? You could use an RS232 for keying the PTT. The data DIN has computer friendly input and output levels - that's what it's there for.

Fuses in the power leads will not protect the radio, their sole purpose is to keep the wires from starting a fire if there is a short. Unless one is running a really high-current bench supply (mine is 85 amps), fuses probably are not necessary as the bench supply will fold back or blow its own fuse before the wires get that hot.

Try this..
Reduce the power output on HF/50 to zero..does it recycle the power?
Do it on all modes..
I have been working on as 706 that was hit by high voltage and it wiped out all the PA transistors that were on the 12 volt rail..If it does it on a car battery it is not a current or power supply issue.(if the battery is good) It is starting to sound like a RF voltage on the B= or 5volt rail of the radio..the RF will reset the Power switch circuit.

From: John Geiger
Topic: 18537  Message: 18537

I have for sale a Comet CF-706 diplexer which splits aparts HF/6m from 2m/70cm. Uses a SO239 jack on the common input and has leads with PL259 jacks for the HF/6 side and the 2m/70cm side. This diplexer is perfect if you want to use a Icom 706 or Yaesu FT100/857/897 with one antenna for HF, VHF and UHF, or also for a Yaesu FT8900 if you want to use different antennas for HF/6m and 2m/70cm.

THese sell new for $70 plus shipping. I am asking $40 shipped and can take paypal/check/MO.

Also have a Jetstream 2 position antenna switch for $17 shipped if anyone is intersted in that.

Hi Steve

I had a very similar problem. My 706 power cycled and the relay clicked intermittently even when I wasn't transmitting. It came good for a while and then started again. I tracked it down to a break in a track on the PLL board thanks to Google and Mike (N1EQ).

I have uploaded a file with the details for those interested. Mine was not as bad as the one shown in the pictures. It was only a small break in the track. I could measure it with a multimeter. The track supplied power to the CPU. I fixed it by simply bridging the break. It is all working fine now.

>
> To the group;
>
> I own a 706MKII that has been misbehaving in the past year. The unit powers down and then comes back on when I transmit in SSB ☐ 1.8 to 50MHz only. The VHF FM operation is OK. Looks as if the problem goes away if I reduce the transmit power to level 7. The problem occurs in the car (battery power) as well as on the bench (15A DC supply). The bench power cord has no fuses and measuring the voltage at the internal 4A fuse shows the voltage is still there even though the power down mode happens. Another symptom, the internal relay does click off during a recycle mode.

I have a VHF repeater using a RLC2 controller by Link Communications. Also attached to the controller is a ICOM Mk2 (not G) as a link radio which I MANUALLY switch from either 6M or 10M, this allowes me to use 10m or 6m via the 2M repeater--everything works fine. My question is does anybody have any ideas on how I can remotely switch memory channels on the 706? I have programmed 2 channels,one 6m and one 10m channel but want to get out of having to drive to the repeater to switch channels depending on what we want to use. I have available touch tone control output using the controller and also can switch a stand alone external relay via the internet available. I dont necessarily need feed-back on which band is selected just be able to toggle between the 2 channels. Any ideas would be appreciated. 73 JIm

From: kb0swo
Topic: 18544  Message: 18544

I have an IC 706MKII that my daughter plugged into the rj45 port on my computer. The computer was off and unplugged but the radio instantly went dead... It blew the fuse on the power supply. I have tracked the fault to the PA board... I checked the power reversal protection it's ok. i removed the R35 large wire wound resistor 5W .012OHM resistor this allowed the radio to power up but with no RF output. My question is were would I look beyond that for a fault... If the finals are shorted will this cause the radio to blow the power supply fuse??? I only have a DMM to test with any type of help. Reference point to test any equiptment I can build links to info or test equipment is appreciated. What is the state of the relays on the pa board. What else might be causing this problem... This is the only board under test at the moment, nothing is connected to it the board is not in the radio and on my workbench i can only supply it with 12 volts low amperage or the recommended voltage or 5 volts at about 3 amps for testing purposes... I am not in the market for another radio nor can I afford to send it to a repair shop... I would prefer to attempt to fix this myself if I can.

Very good condition Icom IC-706MKIIG HF/VHF/UHF transceiver. Includes DSP, UT-102 Voice Synthesizer, HM-154T Touchtone mic, mobile mounting bracket, separation cable, remote head mount, power cord, box, manual. Has some small scratches on the chassis and a small dent from mobile operation. Head is in excellent condition. The only functional issue is that the internal speaker does not work, unit works fine with an external speaker or headset. A small external speaker will be included.
$675 shipped CONUS, will consider a Macbook/Macbook pro or Intel Mac Mini in trade.

Subject: [ic706] IC 706MKII PA problem

I have an IC 706MKII that my daughter plugged into the rj45 port on my computer. The computer was off and unplugged but the radio instantly went dead... It blew the fuse on the power supply. I have tracked the fault to the PA board... I checked the power reversal protection it's ok. i removed the R35 large wire wound resistor 5W .012OHM resistor this allowed the radio to power up but with no RF output. My question is were would I look beyond that for a fault... If the finals are shorted will this cause the radio to blow the power supply fuse??? I only have a DMM to test with any type of help. Reference point to test any equiptment I can build links to info or test equipment is appreciated. What is the state of the relays on the pa board. What else might be causing this problem... This is the only board under test at the moment, nothing is connected to it the board is not in the radio and on my workbench i can only supply it with 12 volts low amperage or the recommended voltage or 5 volts at about 3 amps for testing purposes... I am not in the market for another radio nor can I afford to send it to a repair shop... I would prefer to attempt to fix this myself if I can.

Try Mods.dk or Qrz.com for the schematics. I can only think that an incorrect RJ45 might burn out the +8v regulator that has a connection on pin 1.

As its a MKII, I dont have the manuals, they had Bipolar finals, the possibility is if they are biased hard on they will blow fuses. Finals usually are powered continuously from the +12v supply, just enabled for transmit by applying bias.

Ralph... Would this cause a dead short on the PA board... This is my first problem. I have a dead short on the PA board. I removd the resistor that is in line as at my best guess a voltage reference for the finals. I don't have a resistor of low enough resistance to replace it at the moment or a meter of low enough reading to correctly test it it is a 5W 0.012ohm resistor and the lowest test level on my meter is 200 ohms it registers 0.8ohm so I have no clue. I do have the schmeatics for the radio just no knowledge of test procedures and only a DMM for test equiptment... I can't power the board to test for voltages at least half of the board anyway....

I got mine on a site called repeaterbuilder.com....if I goof it google it and you will find it..go to the Icom section and 3/4 way down you will find the 706's ..

The unit I have was hit by lightning and I have re-built most of it and am now waiting for parts ..the vhf is on the air from parts I found in some old commercial junk I had..

I doubt anything plugged into the RJ45 would cause a complete short on the PA board. However there are plenty of places a short could be happening once the covers are removed. Need to make sure no screw or washer or grounding clip has got misplaced. A short such as the finals drawing enough to blow the fuse is a possibility if the +8v regulator got destroyed, or if the finals are not getting the correct bias (this depends on the RF power setting, and might be wrong if the board is not installed with the radio). You might want to unsolder the choke / transformer that feeds raw 13.6volts to the finals and check for the short again. Maybe a capacitor has shorted to ground, in the +13.6volt line.

I have a 706 original and a MK2g, but no troubles with the finals. The SWR bridge can burn up a trimmer, but this doesnt cause the short you are reporting

Topic: 18556  Message: 18556

I am having a problem with the ic 706MKII. I key the mic on 2M in any mode ssb am fm rtty and even at low power the meter goes full scale PO. This has been an intermittent problem used it fin on 2 meters about 2 hours ago for a quick qso. 15 minutes later i keyed it on same freq and full scale but it didn't trip the repeater. decided to see if it would register on another radio and even with the antennas 3 ft apart nothing didn't even register on the other radio... I have had more problems with this radio than anything else i've owned... just got done replacing the hf finals in it... Any ideas this problem reared it's head b4 the hf finals went and is very intermittent...

To read freq on the 706 you will need a CI-V cable / interface as well as
the control interface.

earlier in the week I found I accidentily engaged my VOX and my radio would key up when I layed the mic down.

Is it possible your VOX is on and set to high sensitivity?

The original IC706 had HF and 6 meters at 100 watts and 2 meters at 10 watts.
the MKII bumped the 2 meter power up to 2 watts i think and then the MKIIG added 440 band to the radio.
I own an original bought shortly after they came out.

I have both an original 706 and a 706 MKII. In addition to the doubling of power on 2 meters from 10 watts to 20 watts, the MKII added enhancements to allow it to enable an AH-4 to tune 6 meters (which an AH-4 won't do with an plain 706), and the AF DSP option was available beginning with the MKII.

Of course, the MKIIG boosted the 2 meter power even more (50 watts?), added 440 MHz band and DSP as standard, I believe.

DSP is an optional upgrade for the MkIIg although it seems to be bundled frequently as an incentive.

The other important difference is that the MkII and MkIIg have the industry standard 1200B, mini-DIN packet data port.

OK, didn't know that the DSP was optional on the MKIIG as they all seemed to have the DSP included.

Not familiar with the "standard 1200B, mini-DIN packet data port." My third rig is an IC-7200, and that's what I use for all my digital operating (that USB port sure is handy). Is the DIN port you mention separate from the ACC port and CI-V port?

Roger that Larry. Your 7200 has it too. It looks like a mouse port tucked away near the 13-pin accessory socket.

So the MkII models have the 13-pin for RTTY type modes and other accessories; the mini-DIN for packet; and the CI/V

The 7200 has those plus the mini-USB (I've got one too - lots to like about it but I wish it had a better data mode implementation, selectable along with CW/RTTY/SSB etc rather than a deep menu option).

Joe,

Your comment about the MKII having the mini-DIN data port got me looking, as I had not seen that on the rig, nor in the instruction manual.

At a minimum, I can say that mini-DIN port is NOT included on my MKII nor mentioned or shown in the instruction manual.

It apparently first appeared on the MKIIG (or perhaps later versions of the MKII). The MKIIG manual shows it and states: "
"DATA JACK [DATA] (p. 12)

6-pin min DIN jack to connect a TNC, etc. for packet

operation."

Definitely not on my MKII, however.

Your comment about the MKII having the mini-DIN data port got me looking, as I had not seen that on the rig, nor in the instruction manual.

At a minimum, I can say that mini-DIN port is NOT included on my MKII nor mentioned or shown in the instruction manual.

It apparently first appeared on the MKIIG (or perhaps later versions of the MKII). The MKIIG manual shows it and states: "
"DATA JACK [DATA] (p. 12)

6-pin min DIN jack to connect a TNC, etc. for packet

operation."

Definitely not on my MKII, however.

Subject: RE: [ic706] What's The Difference...

DSP is an optional upgrade for the MkIIg although it seems to be bundled frequently as an incentive.

The other important difference is that the MkII and MkIIg have the industry standard 1200B, mini-DIN packet data port.

Subject: Re: [ic706] What's The Difference...

I have both an original 706 and a 706 MKII. In addition to the doubling of power on 2 meters from 10 watts to 20 watts, the MKII added enhancements to allow it to enable an AH-4 to tune 6 meters (which an AH-4 won't do with an plain 706), and the AF DSP option was available beginning with the MKII.

Of course, the MKIIG boosted the 2 meter power even more (50 watts?), added 440 MHz band and DSP as standard, I believe.

Subject: RE: [ic706] What's The Difference...

The original IC706 had HF and 6 meters at 100 watts and 2 meters at 10 watts.
the MKII bumped the 2 meter power up to 2 watts i think and then the MKIIG added 440 band to the radio.
I own an original bought shortly after they came out.

DSP was an option in the MKII. But it has always been included in the MKIIG. The biggest probnlem with the MKII is the horrible overshoot, regardless of where you have set your transmit power. I'd be afraid to drive an amp with it. I have both a MKII and a MKIIG. On the MKII, even if I set power to minimum, it overshoots to well over 100 watts on the first dit. The MKIIG overshoots 7-10 watts when set to less than full power.

Phil,

Is the "overshoot" problem as pronounced with the "original" 706 as with the 706MKII?

TU Jack!

On page 35 of Instruction Manual, top image, Connection for RTTY (FSK), note the 3-conductor plug. As I read it the ring is pulled to ground (PTT) and the tip is keyed with the FSK drive, an RS-232 line, DTR etc. What current do I have to sink using a transistor to do it?

I find my 3904 circuit fails to drag it to ground, still well about the approx .7v level. I have a 1k base resistor. Maybe too large.

TU for your interest.

Jack: HF band. No TNC, just an application that manipulates the various pins on the computer RS-232 connector. I've been through so many apps that past day or so and I am not sure what one. Possible MMTTY. In the end I want to toggle the pins (or least least some) on an RS-232 device, which switches a 2N3904 with a 1K resistor on the base, open collector, in turn switching the RTTY lines on the 706.

Confusing?

no not confusing, but you are putting both the computer and radio at risk
this way. you really need a bit of isolation in the circuit they is a nice
but not to expensive interface out there made by buxcomm (www.buxcomm.com)
you plug it into the usb or rs232 on your computer then with the right cable
it can plug into the 15 pin port on the 706, it is what I use in the truck
to interface the 706 to run psk with HRD and DM780 as well as several other
programs.

An opto-isolator is a lot cheaper than the Buxcom device, especially if one is already breadboarding an interface circuit.

Regards,
Ed

From: V
Topic: 13926  Message: 18589

Thank you for all the tidbits. I still am curious to know what the current requirement is to drag those pins to ground. I'll just put a small resistor to ground from each pin and measure the voltage across the resistor. That should give me a ballpark value I believe.

Again, TU for the help.

Vern

Yes but not all of the regular optoisolator work with the 706. The one that worked for me after trying many others was the lca110

My Internet has been dead for a week.

Does the meter indicate signals telling you it's just a audio problem?

which progam soft ware do I need and what cable do I need to find/make
to program my 706 with a computer ? preferably my dell d610 with serial and usb ports avail
I know I can build the serial cable with materials on hand and might manage the usb cable
if i had a schematic
later I might want to control the radio totally but for now I only want to enter the memory
channel data by computer.
Thanks daryl kb5zxm

From: Larry J. Ford
Topic: 18595  Message: 18597

From http://www.ab4oj.com/icom/oldicom.html :

"IC-PS55 - $75 to $100. This is a linear regulated PSU (13.8V DC/20A). Originally designed for the IC-735, it will power any 12V 100W-class HF transceiver. The IC-PS55 has a pigtail fitted with the standard 6-pin Molex plug."

If 20 amps is the peak current output of the IC-PS55, running a 706 at highest power out settings in CW or RTTY modes might tax the PS a bit. I run my 706 off a Samlex SEC-1223, rated at 23 amps continuous and 25 amps ICS, or off of an Astron RS-35A.

Otherwise, you should be fine and sounds like the power plug will fit.

It'll fit, but you'll have to come up with some way to turn the
supply on. Two of the six pins are used in the 735 to control
the AC side of the supply. They are absent in the 706.

So, the ON/OFF switch on the 735 controlled the PS-55 and the PS has no separate ON/OFF switch?

If so, guess it won't work with the 706 even though the plug may fit!

I use mine with an Icom 746 and Icom 910. I just tapped into the two wires and control it via external switch. Or you could jumper it on all the time, and control it with an outlet strip or other AC control.

I added a switch to my Icom supply, on mine it happens to be two blue wires
that go to the plug so I added a small switch in the case and added jumpers
so the switch can close or short the two wires when on and turn the PS on.
Took all of about 20 minutes to do.

Yes, but not at the same time while transmitting. Dual receiving is
ok. Simply limited by the current capacity of the supply.

# 18605. IC-706 MK1 Problems

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-11 22:14:53 UTC
From: sally.dixon50
Topic: 18605  Message: 18605

Hi all.
I have just joined this group as I got hold of a 706 MK1 today, I swapped my old rotator unit and controller for the rig.
It came without the power lead or microphone, not too much of a problem, the power lead from my TS-440S fits and is wired correctly, so I am going to but a mic for it soon.

Ok, heres the problems, the RX signals are very low, for example, I am listening on 144.800 to the local APRS digipeater, on my other rig I get S9+30 but on the 706 it is not even registering on the meter, although I can hear it fairly clear.
Also, there is no TX output, I have connected a morse key up because I have no mic, it is going into TX mode and the red TX LED is lighting up and the rig is drawing about 1amp from my PSU but no RF output at all, on ALL bands.

I would have thought that if it was the PA stage faulty then it would not be all bands, surely the PA stage is different between HF and VHF ?

It is almost as if a relay may be faulty, or a bad connection somewhere that is causing both issues, I could do with a service manual but cannot seem to find one anywhere on the net, if anyone has got a copy would they kindly E mail it to me please ?
Sally@....uk

I have printed out the user manual, used up almost all my ink LOL it is 60 pages !!!!!!!!!!

Many thanks in advance and hope to natter with everyone on here soon.

Hi Sally,
 On page 47 of the owners manual " Trouble Shooting " it say's" Check antena connections, HF to six meters uses "ANT1"  VHF uses "ANT2".
 Another possible is the " ATTENUATOR function is activated.
  Hope that's all to "fix" it.
73,
Art

As stated, I managed to get hold of the service manual but it is beyond my scope to repair it, I am going to see if anyone can repair it for me or I will sell it, not sure how much I would get for it though.

It is in pretty good condition but no power lead or microphone came with it.

Be a shame to have to get rid of it, I was hoping to get it all working so I can use it.

Hi all and thanks for the E mails.

I managed to get a service manual finally, downloaded it in PDF format.

Without the proper test equipment it really isn't going to be too easy to work on, the RX is definitely down, even with another rig into a dummy load it is only RXing about an S7-8 although on 6m it does peak to S9+

I am able to RX on HF with the pre amp on but if I turn that off the signals all but vanishes

Also there is no TX output, it can be heard on another receiver close by but with a dummy load and power meter connected there is not even a flicker of RF coming out of it, I am convinced it is not the RF transistors failed because it is all bands that has no output.

Guess I am going to have to find an Icom service centre locally and see how much to get it repaired, will make a nice back up rig or use portable.

If anyone has got any ideas as to why I might be having these problems then please point me in the right direction please.

Regards

Sally

Sally-Ann,

Do you have a multimeter?

If so, check the section on PLL Adjustments (it's section 4.2 in my IC706 MKIIG handbook). Check the Reference Loop Lock Voltage, and the Main Loop Lock Voltages (there are 3 of these).

They do go out of specification over time, and if they do, you can end up with no PLL; and therefore no TX or RX - potentially on all bands, if all are out.

Good luck with it!

73,

Barry

Sorry if this has been mentioned...

No RX? Have you tried setting the RF/SQL knob at 12 o'clock to see if that helps? First thing on my mind.

Again... sorry if mentioned or covered already, and I do wish you the best of luck fixing your issue. I am sure you will get it! This is a good group of people here.

Hi and thanks to everyone for the useful hints.

Barry, I will give that a check over later, I have a decent digital MM so will put it to good use and check all the VCO voltages.

Will let you know my findings later

Regards

Sally-Ann

Subject: Re: [ic706] IC-706 MK1 Problems

Sally-Ann,

Do you have a multimeter?

If so, check the section on PLL Adjustments (it's section 4.2 in my IC706 MKIIG handbook). Check the Reference Loop Lock Voltage, and the Main Loop Lock Voltages (there are 3 of these).

They do go out of specification over time, and if they do, you can end up with no PLL; and therefore no TX or RX - potentially on all bands, if all are out.

Good luck with it!

73,

Barry
VK3BJM

Subject: Re: [ic706] IC-706 MK1 Problems

Hi all and thanks for the E mails.

I managed to get a service manual finally, downloaded it in PDF format.

Without the proper test equipment it really isn't going to be too easy to work on, the RX is definitely down, even with another rig into a dummy load it is only RXing about an S7-8 although on 6m it does peak to S9+

I am able to RX on HF with the pre amp on but if I turn that off the signals all but vanishes

Also there is no TX output, it can be heard on another receiver close by but with a dummy load and power meter connected there is not even a flicker of RF coming out of it, I am convinced it is not the RF transistors failed because it is all bands that has no output.

Guess I am going to have to find an Icom service centre locally and see how much to get it repaired, will make a nice back up rig or use portable.

If anyone has got any ideas as to why I might be having these problems then please point me in the right direction please.

Regards

Sally..

I have a 706 mk2 that was hit by lightning and I had to re-build the complete HF and Vhf stages..(It was nuts but I needed a challenge)

I have a few questions That may help me to narrow down..

On VHF is it buggered as well..the vhf has a differnt route than the hf.. BUT in the middle they share some circuits.example there is a relay that directs the various outputs in a pre-driver stage...In the tx side it could be as simple as a bad relay....
If you have some low level tx and rx the pll brd is most likely good....it is staring to look like a 12 volt rail problem..the complete PA sections on both VHF and HF use the 12 volt rail..the only device that is shared is a fet on the input to the pa....

give me a few more clues..it is starting to look like a B+ rail or common voltage issue...

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-12 15:08:22 UTC
From: Sally-Ann Dixon
Topic: 18605  Message: 18614

Hi Bruce and thanks for the reply.
I am currently listening to some contest stations on 80m and although some are coming in fairly loud and clear the S meter is not showing a lot, and I have to keep the pre amp switched on, I know it is not my antenna, I have got a 110 foot dipole with 40m traps up on the roof of my 3 storey block of flats, spanned between the chimneys, running the full length of the block, and when connected to my TS-440S HF rig I get really good strong signals.

On the other bands I can hear signals, some weak and some a bit stronger (normal I guess for HF), and on 40m I can tune to the broadcast band and hear stations, some of them actually give an S7 reading on AM but once again this is with the pre amp on.
It looks like the rig has been modded because it covers RX right thru from 160 to 2m and it even covers the 4m band, I have got a 4m hand held rig here and if I key up on 70.450 and have the 706 on this frequency, with the pre amp on, and the hand held about 3 inches from the 706 it does RX the signal with pre amp on but only about an S4-5 so definitely deaf on RX.
I can also hear signals on 20m it is almost as if the higher up the bands I go the worse the RX gets, so maybe this points to something out of adjustment ?
6m is quiet at the moment here so cannot really check that, although it does RX weakly on this band because I have got my FT-736R into an external tri band vertical and if I TX on this the 736 does hear it but once again very weakly (I am using the wire dipole as an RX antenna on 6m as it shares the same antenna socket as HF on the 736)

I am convinced that the RX problem might be bad tuning, or maybe there is something common to RX and TX that is causing both problems ? as you said, possibly a common +v rail somewhere ?
I wonder if maybe the mod that has been done could have caused the problem ? although I don't know where to start looking and I really don't want to remove the mod unless it is really required, I would like to keep at least the general coverage RX on the rig.
I would love to be able to get the rig sorted and fully working without having to spend a lot of money on it, I swapped the rig for my old Kenpro antenna rotator and controller with a local ham station, he said that as far as he knew the only problem was the lack of TX.
I am also trying to sort out the wiring for a microphone as one did not come with it, I have some spare microphones here and have got some brand new RJ11 I think they are, plugs and a crimping tool, so can probably get a microphone wired to use with it for now until I can afford to get the proper one, I also need a DC power cable for the 736 as I am currently using the one off my TS-440S which is the same fitting and connection, I did check this first before plugging it in.

Well, any further thoughts would be greatly appreciated, and if anyone happens to have a spare DC power lead and ideally the right microphone, going spare, I would love to take these off your hands (I am so cheeky I know, but if you don't ask you don't get) Hi Regards

Hello all,
I'm wanting to wire a vibroplex brass racer to the quarter inch stereo plug, any pointers on how to wire it? It has the keyer and speed built in it, so would you set the ic-706mkii menu for straight key?

# 18616. Re: Brass racer

Hi there

I would say that if you are using anything other than a paddle then set the menu to straight key mode, I connected a key to mine to be able to throw the PTT and I had to set it to straight key in the menu for it to work.

Hope this helps

Sally

Wire your keyer output to the ring terminal. Tip is unused.
Ground to Shield.

Set the 706 to "bug" mode.

Done.

OOPS! I looked in the 706 manual and got:
On the original 706 (this group) Tracing the schematic for the FSKK line, I get 1.7 ma.
That's from 8 V Vcc and 4.7k.

On to the MKIIG manual. Stand by...
Same circuit.

Hard to believe a 3904 can't do that. What's on the input end of that 1 k resistor?

And Steve Added:

And the threshold is around 2.1 volts, so you only need to get below about 2 volts, but, of course, lower is better.

# 18622. IC-706MKIIG no TX on FM (2m and 70cm)

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-14 02:24:43 UTC
From: johnsaffrey
Topic: 18622  Message: 18622

Hi all,

I have recently purchased an Icom IC-706MKIIG from a store in QLD Australia. The unit is second hand and was supplied with a one month warranty. I contacted the seller and they are not willing to warranty after only 7 weeks - very disappointing.

The issue is this: when TXing on FM at 144 or 438 the set pulses to the set power level then drops right off to nearly zero. Other modes appear to work ok. I have not tried FM on HF or 6m (I will do that this evening).

I have checked the following:
- Power supply
- Antenna
- Power output
- Factory reset on the CPU
- AM appears to output the correct power level

I have a copy of the service manual but have limited tools for testing.

Do you chaps have any pointers. For instance is this a known issue etc?

Cheers,
John
VK6RX

Hi,

Thanks for your response. I had a look at the radio again earlier today along with a closer read of the service manual. You are correct in saying the fault is in the FM VCO. I managed to pin-point the fault to the C1022 trim-cap. It looks as if this has been replaced before. Also further testing revealed FM to be faulty across the bands.

For now a turn to each extreme and tweak back to the service manual specs (testing from CP1011 it should read 1.8v with the radio set to 29MHz, at full power into a dummy load) sees the radio back to 100% on FM again.

I endeavour to replace the trim-cap in the near future once I track one down.

Cheers,
John VK6RX

# 18626. Front panel headphone jack & kerchunking

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-16 07:28:46 UTC
From: wb7oec
Topic: 18626  Message: 18626

When I plug an 8ohm external mobile pa speaker into the front panel headphone jack on the MKIIG the rig will begin to spontaneously key the transmitter intermitently. I do have the switch in the speaker position. It will key ~1-2 sec then release then cycle again in a few seconds.I tried a different speaker in the car same results. I can iniate it by keying the mike sometimes. Occurs when radio is on 2meters, 440 & 6 meters. If it is RFI feedback from speaker wire what combination of capacitor and rf chock would be best to relieve the problem. Any ideas? TNX de Greg WB7OEC

# 18627. Re: Front panel headphone jack & kerchunking

I have no idea if it will work but I've heard tell in days gone buy of wrapping the speaker wire around a lead pencil. Should be easy enough to try. Wrap tightly an secure somehow.

Sounds like you have a lot of RF floating around. What's
the antenna setup? Caps and chokes would only address the
symptom.

From: Mike
Topic: 18615  Message: 18630

I don't know if you've got this solved yet, but I'm using a Vibroplex Brass Racer with mine occasionally. The one I've got looks like the one here:

http://www.vibroplex.com/brass_racer_iambic.html

Although yours could be square, if it's a paddle, it's wired the same. You'd wire it according to the picture on this drawing here:

http://vibroplex.com/brass_racer_iambic_machine_drawing.htm

And plug it in as a standard paddle. If I remember right, I set the keyer menu on my rig to 'n' for normal, although you may prefer 'r' for reverse, which switches the dit and dah contacts.

The only reason I'd leave the keyer off in the rig is if you're using an external keyer, a bug, a Vibrokeyer (which is a Brass Racer with a built-in keyer), or a Blue Racer. Good luck and enjoy!

73,
Mike, WA0ZOG (ex. KA9RQW)

# 18631. SWR Meter Adjustment

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-19 02:36:19 UTC
From: tj
Topic: 18631  Message: 18631

I have an IC-706MKII and I noticed a difference in its SWR indication and the measured on my Diawa CN-620B and MFJ Versa Tuner V. So I decided to recalibrate it as per the instructions on page 4-9 of the service manual. I jumper'ed a 3.5mm for the remote port terminator and made up my loads. I used a Heathkit cantenna and a Microwave Devices 150W (good to 1GHz). To get the 25 ohm load I used a 'T' connector DIRECTLY (no coax jumper) on the ANT 1 (HF) and of course one of the dummy loads directly to it for 50 ohms.

Ok, I put the terminator the remote plug, hold down P.AMP/ATT and TUNE/CALL and turn on, power and I am in the set up mode. Now select TX and then BAND UP to get to "SWR 1 LOAD". I connect 50 ohm and hit MENU. Now, according to the manual it should transmit for a while. It doesn't. It beeps twice and goes right to "SRW 2 LOAD". But, I go ahead and connect up the 25 ohm arrangement and hit MENU. No transmit, it just beeps twice again.

Now, I always indicate a 1:1 SWR not matter the load or actual SWR.

What am I do wrong?

Also, for setting ALC +20dB LEVEL it says use a 1.5Khz audio signal at 100 mV, Is that p-to-p or RMS?

Meters will almost always differ. Mine do on the mk2 and mk2g and diamond meter and palomar meter. Some of it has to do with placement in the line and how said meter measures it.

Doesn't explain why the meter set up procedure isn't working like
outlined in the service manual. And, now why it says ALL loads, even
when the SWR is actually 3:1, are 1:1.

# 18638. HF intermittant TX problem On MKIIG

Yahoo group: ic706 (2010 — 2015)
Date: 2011-02-22 14:22:48 UTC
From: cpd0929
Topic: 18638  Message: 18638

I have an intermittant problem with HF TX.
It affects all HF freqeuncies, but not UHF or VHF.
Does not seem to matter whether the radio has been on a while or not.
HF all of a sudden will only TX very low power.
The strange thing is to overcome this I can switch to VHF and key the radio once, then go back to HF and I get full power out on HF.
I have tried to do a full radio reset and ther is no SWR showing on my HF dipole. Radio has never been mobile
Any suggestions?

Hello George.
I had a problem somewhat like yours only worst (and it got worst with time). My IC-706MKIIG developed a problem in that it would drop in BOTH tx & rx on ALL bands. At first i could key the mike a few times and it might come back but later you just had to wait until it came back on its own. The strange thing about mine was it only did this during the warmer months of the year. During the winter it would work fine.
Anyway, i finally sent it to a repair shop and he replaced an RF coil (i don't know which one) and It's worked great ever since (2 years).
Your problem may be caused by something else but, anyway, for what's it's worth that's what happened to mine.
Best of luck. They're a great little radio.

If you have Excel 97 or later, my Spreadsheet does this and more and you have all the power of Excel

I have a unique semi-automatic method of very easily entering Memory CTCSS frequencies. It DOES enter individual offsets as well as non standard splits for repeaters and regular HF splits.

It can not enter the Memory Name because Icom did not provide any command for that. It cannot *read* CTCSS or memory names for the same reason. Not my fault.

Look for this file in the CAT Folder:

706 MkIIG_ Excel CAT Sheet 5-12a.xls

A later version is on my web site and I have a newer one that must have other improvements that I haven't uploaded here. If you want that just ask. I'm at arrl.net or there is a contact page on my site..

OOPS. The one on my site is the one in this Files Area. I have a newer version, but it has possibly unfinished additions.

Topic: 18643  Message: 18649

Art, Well ... I'll try.

I'm not sure I understand. If you have the manual on CD, that's your best bet. Look on page 34. You can also download a Owner Manual from one of these:
http://mods.dk/
http://www.kb2ljj.com/
http://www.retrevo.com/samples/index-I.html

I don't have the radio, but I do have a copy of the manual since I help a local blind ham with his. I haven't adapted my Excel sheet for the original 706.

I don't know how much you know, so I don't know how much detail to give; plus without a radio, I may miss a step or button....

Here's an abbreviated summary from Page 34:

You can do it either from VFO mode or memory Mode. II only show doing it from VFO mode here:

When I say Push, Push but DO NOT Hold it.
When I say HOLD, Push and hold it for 1 second. I believe there is a second beep.

FIRST: Standard FM repeater offsets are called DUPLEX (DUP) and are set in the Quick-Set Menu like this
1 - I believe you must start with the radio in the ham band you want to set the offset for.
2 - Turn Radop OFF.
3 - HOLD THE LOCK BUTTON while turning the radio on.
4 - Push [MENU] or [UP/DN] to get to the menu : 17 DUP OFFSET
5 - If it is not already correct, use the main dial to set it.
6 - Turn radio off, then on again for the rest.

Now the memory:

1 - Push [DISP] until M (the "M" Menu) appears (along the bottom of the display)
2 - Push [MENU] until you get to the M2 Menu.
3 - Push V/M so that either VFO A or VFO B shows.
4 - Now program the frequency and mode you want.
5 - If you want a tone for this memory:HOLD [DISP] to get to the "G" Menus
..... Push [DISP] to get to MENU Q4 FM TONE
..... Use the main dial or UP/DN to set the Tone Frequency
......Push [DISP] to get out of "Q" MENUs
...... It should go back to Menu M2
6 - Push the [UP/DN] buttons to get to the desired Memory number. If it says [BLANK] then that one is empty.
7 - Push the HOLD the MW button (Memory Write)

Done

It you need more I suggest joining the Yahoo group that is still active:
http://groups.yahoo.com/group/ic706/

My Excel spreadsheet that is in some Yahoo groups and on my web site only does the MkIG.
I have a manual and It goes llike thins

In answer to my question .
I have a vanilla IC706,and was wondering how to program the memories for frqy and offsets,as well as tones .
If it programs the same as say the 706 mark 2,Ithink I can get a "cheat sheet" from the Mini Manual people. Otherwise it's re-reading the manual off the cd and the such .
If you have the information I need,it would sure be a help. Or- if there is a program that I could get to program it from the computer, that would work also.
Thanks,
Art

From: John Geiger
Topic: 18651  Message: 18651

I am looking for an Icom 706MKII or Icom 706 original in good operating condition. Needs to have the mic and power cord with it. Any other accessories, boxes, and manuals are nice but not needed. I can pay with paypal or MO. Let me know if you have a spare around, and price shipped to Lawton, OK.

From: w6bts
Topic: 18652  Message: 18652

Hi All,

Can't seem to find this problem in the postings.

I installed my fully functional MKII into my Van. All went well for all tests including on the air with good reports however today I find that the unit is no longer providing DC power to the four pin tuner connection and obviously my AH4 is dead.

I pulled the radio and put it on my bench with the same result.

Any suggestions as to what this may be before I tear into this thing?

Tks & 73,

Dave

dave ..
I looked on the drawings and there are chokes on each line. There is a fuse also feeding that circuit ..but you would have more issues if that was open...If you down load the servise manual it is on the 2nd page of the PA drawings labled J-9..

hope this helps..

Hi Dave - There is a very tine trace on the pc board that feeds that 12V out, and that trace is easily blown. I know - I blew it in my IC-706MKIIG. And unfortunately, it is very hard to get to - but it can be done. I was able to solder a small bus wire across the blown trace to repair it. I don't remember all the details as it has been probably five years ago or so, but I just remember it wasn't easy.

# 18655. Re: [ic706] Re: 706 MkII - No DC at the Tuner Connector

Yahoo group: ic706 (2010 — 2015)
Date: 2011-03-07 04:38:47 UTC
From: Dave Santoro
Topic: 18652  Message: 18655

Hi Phil,

Well that was exactly what it was.

After exhausting all other possibilities I decided to lift the board and after close inspection I found that the $100.00 PCB trace had failed in order to protect the .25 cent 4 amp fuse.

I followed the same process as you did, I installed a solid buss wire bypassing the entire trace although I did repair the trace on the outside chance that it might be used for some future mod or application. The buss wire takes the load and should withstand just about any reasonable current demanded of it.

While in the radio I also decided to relocate the internal 4 amp glass fuse and modified it to a 4 amp mini-blade fuse. I attached the fuse block to the back of the case just below and next to the heat-sink running the two feed and supply wires through a small hole I drilled. Now all fuses may be checked and replaced without having to open the case.

With this modification I expect the radio will never fail again and the resulting convenience will never be appreciated, at least that's what I'm hoping.

Thanks to all of those who offered suggestions' and hopefully this will serve as guidance to any members that might suffer the same fault in the future.

Tks & 73,

Dave
W6BTS

I have a problem on a 706mk11 where it will only change between
two memory channels. I have tried a reset, but didn't help.
Turning the memory knob it goes between channel 1 and 2 only.
It doesn't matter if in memory mode or vfo mode. Any one ever seen
this, or have any ideas?

It started out as just c1 and c2, but a reset and no it is just 1 and 2. They will program and
hold the program, but even in vfo mode whee you should be able to go to any channel
it still only does the 2 channels.

The reason I ask about p1,2 is those are scan edge . I think c1,2 may be call channels. The call light on? I think tuner and call are on the same switch. May be something to do with that.
If I can I'll try to duplicate your problem.

Hello,
a OM offered me a defective IC 706. It seems the automatic bandswitching
when using the VFO does not work anymore.
(The owner told me he had stored the bands into the memory and had no problems at all.)

What could the reason be that Bandswitching no longer works?
Is this a known failure?

well for one the memory are just that in the memory locations. to the right of the big knob there are two buttons and they are the band up and down they should work any where you are in MR or VFO if you can not change the frequency as well then look at the button to the bottom left of the big knob the red light should not be lit that is the lock button.

I have four Icom 706 radios, two 706MKIIg, one 706 MKII and one 706. Is there a software program that is available that I can program my radios via my computer. I have Ham Radio Deluxe but do not see a way to use HRD to program the memories on 706's. One of my friends owns a plastic tooling company, He made me 3 cases for my 706 radios that holds the radio & LDG tuner. All I have to do is put up the antenna and connect the power supply and I have a HF station ready for the Scouts to use. '73 "A Scout is Reverent"

Hi,
just asked the OM, he already did a masterreset but with no success.
The UP/DOWN buttons did not work.
As already said, the owner always used the rig with memory function, due this usage he did not recognise that there is a malfunction.

Hey man,

Check this software out. I use it. There is a free version (which is this), and a paid for version that adds more functionality.

http://www.iz2bkt.com/ic706bkt3en.html

POINTS OF NOTE!!!!

IMPORTANT :

The Protocol CI-V to these RTX is subject to these limitations:

For all models (IC-706 - IC-706MKII - IC-706MKII/G) :
It is not possible read or write memory names.
It is not possible read or write the subtone value.
It is not possible read the setting of the DUP

Only for IC-706 and IC-706MKII :
It is not possible read or write memory names.
It is not possible read or write the subtone value.
It is not possible read the setting of the DUP
It is not possible read the S-Meter
It is not possible read the SQL
It is not possible read or write the Attenuator
It is not possible read or write the Preamplificator
It is not possible read or write the AGC
It is not possible read or write the NB
It is not possible read or write the Tone
It is not possible read or write the TSQL
It is not possible read or write the Vox
It is not possible read or write the BKin
It is not possible read or write the Compressor
It is not possible read or write the Reverse

Hope it works out man!

Sigi, don't lose those memories. I think you can program memories using software if need. I or you can check if you have a mic with up/down buttons that may change bands in vfo mode. Change channels in memory mode.

Sigi, I assume it doesn't change bands in memory mode either using the buttons on the right.

Mike R

P.S. You'll notice you can change the frequency in while in memory mode which is probably what he did.

Which model 706 is he using? In the original 706, the up/down buttons don't change the bands, only the memories. YOu have to use the TS button and the VFO dial to change bands. This was changed in the MKII

Does it have the CAT control cable on it? The little 1/8" plug? I assume so.

If you do have that, then you are good to go!

For what it's worth, my Excel sheet for the MkIIG has a semi-manual subTone entry algorithm that makes loading memorieas easier. I don't recall if it will work on the vinilla or MkII. Sorry.

Subject: [ic706] Re: 706MkII adding the UT-106 DSP Unit?

Hi,

I have a 706MII and would like to add the UT-106. Can you or anybody please tell me how to do this.

Thanks a lot!

# 18677. SWR Reset

Yahoo group: ic706 (2010 — 2015)
Date: 2011-03-30 01:12:57 UTC
From: kd8dvy@ymail.com
Topic: 18677  Message: 18677

Here's two questions for the group. AS I was operating a few days ago after several months of in-operation. I noticed that my external power meter was showing that I was operating at 60w when I was at high power on the rig. I also noticed that I did not have a SWR meter on the display, yes i made sure I was on the right setting.

As I looked into what was wrong and after several long hours of internet research. I remembered that I had posted an original 1st edition 706 manual in the files section of this group (DUH). What I found is that I need to have the SWR detector reset. The manual stated that I need to use an audio generator (see 4-4) along with an RF power meter. I also assume that once you do this you would have to set the S-meter and that calls for dummy load (25ohm, 50ohm, and 100ohms I assume this is to set the lower and upper limits).

Now comes the questions for you guys; Is there a way to reset the internal SWR meter without an audio generator?

And has anyone ever done this before, is so please advice.

Please no off topic answers or long threads.

Thank you all 73's
Harold/KD8DVY

Personally, I'd listen to someone elses and see what you think.
You can't run it above level 2 or 3 without distortion.

Agreed, but it also adds a nice automatic notching function as well. The notch is fast acting and covers up these QRM carriers nicely, yet is narrow enough I can still hear the station the carrier is trying to block. I have a separate DSP speaker which, by itself, is not quite as good on ANF, but in combination with the DSP in the radio works very well for me.

From: zl1tbg
Topic: 18677  Message: 18680

Anything that makes a noise into the mic will do as audio generator. Such as dial tone from a telephone or another radio receiver on ssb with a beat off a carrier.

The 25 ohm load is just 2 50 ohm ones connected to the ant port with a T connector. It provides the set point for calibration of 2:1 VSWR.

I carried out the cal on my Mk2g, however during the process the rig slipped off the bench and the cal did not work, and I was unable to redo it - possibly the 3.5mm connector is damaged. It doesn't bother me as the rig has so many faults yet still goes (like the proverbial Toyota truck on "Top Gear"). My 706 original is vastly better in this regard.

Hi there!

DISCLAIMER:
I assume no responsibility for damage or inaccuracies contained in this document. In other words, USE THIS AT YOUR OWN RISK. It worked for me, however I don't know if it will work for you.

WARNING #1: This mod requires the ability to remove surface mount diodes. Only those who are qualified to do this should attempt this mod.

WARNING #2: This mod seems to erase all memory channels, etc. You may want to save this info for reprogramming.

Disassembly:
Face the front of the radio towards you.
Remove the three screws in a row across the middle of the top of the radio.
Remove the two screws at the top rear (on the sides) of the radio.
Pry the top cover off from the back.
Disconnect the speaker at the connector.

Modification:

Near the top rear of the main circuit board, there is an small, oblong metal can. Directly below the right side of this can is two surface mount diodes with a white silk-screened box around them. There is also what appears to be a circuit board part number just to the left of it (mine says B4916D). Remove the LEFT diode in the box.
To the left of this, there is a test point marked CP3. Just to the left and above this test point is another box with two *vertically* mounted surface-mount diodes (Note: there is also a place for 5 more *horizontally* mounted diodes, with 3 installed). Remove the LEFT vertically oriented diode.

Reassembly:

Reconnect the speaker.
Put the top cover back on. Insert the top cover tabs into the slots and lower into position.
Replace all of the screws.

My radio did not require a reset, however I did lose all of my channel memories. It seems to be able to transmit everywhere except below .5 Mhz. I have not tested the power output at all frequencies yet.

Million thanks Scott, it worked perfectly for my US version.
I want to use it on CB band, hope its power output will be similar to the 10 meter ham band TX. 73s KI6UAV

thanks, it`s done, this DSP makes a difference :) I heard that some ppl are not really satisfied with it, well I don`t think is worse than the bhi types http://www.bhi-ltd.com/ at all, it simply does the job.
I have installed one of those bhi DSP into a Yaesu FT817 earlier but this one is much better, its got more levels/steps to set for noise reduction and the audio is also fine to me.

Roger that all around. DSP (esp audio DSP) won't work miracles, but it really helps under moderately difficult conditions. I've been thinking of a BHI for my FT-101EE, along with an X-Lock. You do get somewhat spoiled with the bells and whistles available even for late 1990s tech like the 706.

From: Jack
Topic: 18681  Message: 18690

KI6UAV,
Do you dislike your ham lic?
use that radio on 11 meters and you may find you will lose you lic. as well as the NAL's start at $10,000.00 USD.
if you want to be on CB the spend $20.00 at the local pawn shop or go to a ham fest or look on EBAY and get a radio that is meant for that. But PLEASE do NOT take a piece of ham radio gear and modify it to use on CB just because it will do more power.... it is people that operate like this that give hams a BAD name!!!
There are many good reasons to expand the transmit on a radio but that is not one of them.

I just looked up your call... you are a Tech you have NO HF privileges and now you have yourself in the spotlight there in IRVINE calif. I understand you are from another country and have moved here. upgrade and operate as you should here or risk it all it is your choice. just remember you can be SENT back with out return postage!
I am sure the local OOs will love the phone call.

The subject of widebanding the 706 will always be contentious and no doubt will crop up again in the near future but for now can we put this thread to bed, thanks.

# 18696. Icom 706 mk2g problems

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-02 11:12:02 UTC
From: Andrew Gordon
Topic: 18696  Message: 18696

Hello all,

I have an Icom 706mk2g
The radio was widebanded by previous owner.
I obtained it in a deal a month ago and it worked fine on all bands.
I switched it on last week and found that whilst it works 100% on 160,80,40,30,20,15,12,10 metres and also on 2&70 the radio now no longer has any 6m coverage.
6m no longer appears on the display and when you cycle through bands 6m/50mhz does not appear for example going down through band selection it goes straight from 144mhz to 28/29mhz.

The radio also no longer has any receive outside of the ham bands.

TX and RX within the ham bands is 100% with the obvious exception of 6m which appears to just not be there anymore.

A full reset did not resolve the problem. Any suggestions?

Regards Andy M0KDB

Andrew,
I'm not sure if you have tried this or not.
Be sure you have your rig in VFO .... NOT memory.
Instead of pushing the band selector,  put rig on FM mode and turn the tuning knob to see if it will tune into 6 meter band that way.

KF4WUI - Tony
73 Have a GREAT DAY !

Hi Tony and thank you for your reply,

The radio is in VFO mode and i have tried putting it in FM mode and seeing if it will tune to 6m that way but unfortunately it does not.

Kind regards Andy M0KDB

Actually, the IC-706 is already wideband from the factory. There is no simple way to narrowband the radio, as it is set for +/-5 KC FM deviation from the factory and +/- 2.5 KC deviation is not not easily an option for the receiver.

Jack (ass),

I'm just going by what they list on their site:

ZIP file. IC-706MK2 Instruction manual.zip 14.720 Kbytes
ZIP file. IC-706MK2 Schematic.zip 549 Kbytes
ZIP file. IC-706MK2 Service manual.zip 24.023 Kbytes
ZIP file. IC-706MK2 Testbericht.zip 674 Kbytes
IC-706MKG ARRL Test-result report.pdf

I think you are the one is not complete and making it sound like I
always give the wrong information. YOU have no idea!!!

Actually I do have a good idea.
I am a Moderator or member in most of the radio related groups and I have seen your posts you like to post, the problem is you do not read the post or your information is done with out thinking about it first.

this person asked for one thing and was VERY specific in what he wanted. You reply was well here is the same info as to what you already have and know is not right!

go back and look at the subject line then look at the list you just posted as you tried to say I did not know what I was talking about, now you see where your mistake is? he does not want the "G" series or the first one that is the original 706 he needs the 706MKII the second radio in the series the one that there is almost no documentation on to be found.

see I can answer you and not find a need to lower myself to the level of calling names or cussing, put your dollar in the jug on the way out!

# 18710. Re: [ic706] Need service manual for IC-706MKII.. not MKIIG

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-03 01:48:50 UTC
From: Teton Amateur Radio Repeater Association
Topic: 18703  Message: 18710

Like I said, I am going by what they are listing and trying to help. And you still have no idea. You say "I have seen your posts you like to post" you and I know better than that, I rarely post because of idiots like you. I'm not on here to fight with you or anyone else. So let it go, I am.

Mick

Thanks to all who replied so quickly. I found exactly what I needed and
will try to adjust the VCO tomorrow to bring back my FM.

From: Jeff Moore
Topic: 18703  Message: 18712

Mick is correct. The mods.dk site has the IC-706MK2 service manual. It's a 24MB zip file. I have it and tried uploading to the list site, however, Yahoo limits file uploads to 5MB so no go.

Get it off the MODS.DK site under Manuals/ICOM:

http://www.mods.dk/manual.php?brand=icom

Scroll down to the line that says: IC-706MK2 Service manual.zip 24.023 Kbytes

73,

Jeff Moore -- KE7ACY

Sounds like the "wide band" mod wasn't done properly - check the diodes against the wide band mods posted online. I think you'll find details at Athens ARC's site.

# 18716. Split Frequency Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-03 13:45:25 UTC
From: Johnboy KI4WCQ
Topic: 18716  Message: 18716

Last night my 706 MKIIG quit working split while on CW. It will switch between VFOs if you are in SSB mode, but won't on CW with a key. In fact, if you key the mic while the mode is set to CW it will switch VFOs, but not if you use a key. In all cases, the display shows that split is on, and checking the VFOs show the different frequencies that I set.

Has anyone had this problem or have any ideas how to fix it? I did a reset of the CPU, but it still won't work split on CW if you use the key.

73,

Johnny, KI4WCQ

I have found out that the key will not put it into TX mode. It has full output on ssb, rtty, and AM, and FM. If I key the mic while in CW and use the paddles, it will TX CW. Otherwise, a paddle or key will not put it into TX.

Johnny,

How are you keying the radio in CW mode? Do you use an external switch, such as a foot switch, connected to the ACC jack, full break-in, or semi break-in? Have you verified that the plug/wiring and/or keying method is still enabled?

The transmit VFO's mode must also be set to cw.

From: Johnboy KI4WCQ
Topic: 18716  Message: 18720

Ken,

I don't use a foot switch, just the key with semi break-in.

Best I can determine, everything is still enabled. It quit doing split in the middle of chasing some DX last night.

Right now, when in cw it only is a practice oscillator. TX light won't come on and no output.

All other modes work fine, do split and have full output.

It puzzles me.

Ki4wcq

# 18722. Re: Split Frequency Problem -Problem solved

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-04 14:50:15 UTC
From: Johnboy KI4WCQ
Topic: 18716  Message: 18722

I reset the CPU a second time and entered my options again. It works now, but still not sure why it quit and why it didn't work after the first reset.

Anyway, I'm happy and thanks for the suggestions. It saved me from trying to figure out how to make my FT 857 do what I wanted. I absolutely hate that Yaesu and its layered menus. It's not as nimble as the 706 with all of the push this, turn that, push this, etc.

Hi Johnny,
Great news. What a relief, huh? I suppose, just like any other computer setup, even a boot-up can have a glitch and not read everything it is supposed to from the ROM.

God bless

Hi Guys,
i am a new member , my name is Bill and my call is G4KKI,
been licensed since 1980.
I have just aquired an Icom 706, early issue, it was my friends who
sadly passed away.
He told me sometime ago it had developed a fault but he just left it and
it never got looked at.
This may have been asked before but i did a search of the messages and
could not find any thing about it.
The fault is on receive only, the audio through the speaker distorts
badly even at fiarly low volume, through the phones socket
it seems ok but at higher levels of audio it does distort a bit. Maybe
someone has come across this fault before and can point me in
the right direction to fix it.
Everything else seems fine and i have had several QSO with it on CW and
a couple on 2mtrs FM.

Original 706 has no DSP and NB does nothing in FM. An audio clip would be nice so we could hear the distortion. Do you have that capability?

Hi Joe,
if the external speaker does not do the trick, then i will
see about recording a clip, i should be able to do that easily
enough, i think my mp3 player has a record option on it.

Hi Joe, guys,
i tried makinga recording but could not find
a computer mic, the internal mic on the laptop was useless, i'll have to
pick one up.
I tried a speaker but it was not much use! I have got a set of
amplified speakers that i used and it was fine through those, from the
phone socket on the front and then from the speaker socket on the back,
i coupld turn the volume up fairly high (on the rig and fed into the
speakers at low volume) without distortion. I'll get hold of a decent
speaker and try that when i get chance, meanwhile it's fine through
phones, which i normally wear anyway. Just worked VP5/W5CW with my
indoor magloop and 5 watts on 12m..

Hi, have just got a diesel Zafira and have fitted the 706 MK2, the fascia is on windscreen and main unit is at the rear, the antenna is fitted to the tailgate with a mount that is earthed by the screws that hold it, the coax is earthed as is the radio but the inteference is chronic, its worse that a petrol engine even on FM, if you remove antenna the noise stops completly so its not coming through power leads,
anyone had the same problem??.

I had a similar problem with a small Toyota many years ago. Tried everything with no luck. Finally grounded the tailpipe near the exhaust end to the car frame and the noise almost disappeared. Seems everything to do with the motor was isolated from the frame and the tailpipe made a very good antenna for the ignition system.

I would ground the body, bed, tailpipe, and motor to the frame of the truck. I have a diesel Ford F250 that needed some grounding to clear up injector noise on 40m. It's still there just much more manageable...

I had the identical problem on a 1969 Buick Skylark using a Drake TR4 (ignition noise that went away when the antenna was disconnected). I placed a conventional AM transistor radio with an earphone installed inside a heavy coating of aluminum foil covering the radio. I used it as a signal tracer on a nonexistant station. The noise was coming from the tailpipe on the right side of the car across the rear of the car to the base of the antenna on the left side of the bumper. I followed it forward up the tailpipe and muffler to the exhaust manifold and engine. To get rid of the noise I filed a bare spot on the tailpipe every 3 feet and wrapped and clamped a braided ground strap to the exhaust pipe with a radiator hose clamp and grounded the straps to the frame of the car. Went from 20 over 9 to barely detectable. That muffler tailpipe combo was about a quarter wave on 20 meters???????????? Anyhow, the ground straps worked.

When you say earthed by the bolts that hold the bracket do you mean you've drilled through the body work to bolt on the bracket. If you're running a boot lip bracket held on by grub screws then you don't really have an earth at all. You'll need a good solid earth (not braid!!) to the tail gate and a good solid earth from the tail gate to the body. Have a look at K0BG's site - he is the guru of mobile instalation.

When you say it goes if you take your foot of the accelerator, does it return if the engine is out of gear and idling or if you push the clutch in when moving? If it does it sounds like injector interference and I've yet to see a cure for it, grounding and shielding can reduce the effect but nothing I've found online or done myself has cured it. My TD5 Disco is just as bad but fortunately it drops off into 10m as that's my favourite band at the moment.

Hi Guys,

Just to keep you all updated and to thank you for the great advice.
People may also find this solution helpful.
I posted on here that my MK2G had lost 6m rx and tx and also RX outside ham bands.

I had it checked out by a local ham who has experience of these radios. What he found was that when the previous owner had widebanded the set some of the track above where the pad is removed to wideband the set had been damaged and hence a circuit had been broken.Apparently all the track should be joined together. He installed a small jumper and my radio is good as new

Thanks again for the advice

Regards Andy M0KDB

Hallo Paul,
its only there when accelerating nothing when foot off, have
been told that it is the electronic injection system someone else has the
same motor with same problem and the 706 is worse for it than other radio's
I tried to use DSP to cure it but after setting 4 it ruins the incoming
signal, going to try a Alinco DX70 see if thats any better.

What do you recommend for grounding straps (or what every they might be called?). I've seen (on the internet)copper strips used. I've managed to collect at various hamfests over the past couple of years, a number of tinned, braided straps with ring connectors on the ends that I thought might do the job.

I want to install an IC-706MKII in my 2006 Honda CR-V, with an AH-2 or AH-4 mounted up in a cavity just aft of the left rear wheel and forward of the rear bumper, right at the feed point for an AH-2b mobile antenna system. The support attachment for the AH-2b would be to the frame just forward of the rear bumper. The antenna part would extend vertically just aft of the left rear wheel.

Has anyone used or is using a Heathkit HD1410 keyer with an IC706, i
have one here that i would like to use.
I'm not sure what i would have to do to the keyer to get it to key up
the rig.
At present i am either using hte internal keyer or a pico keyer but i
like the HD 1410 and would like to use it
here in the shack. It keys an FT840 with no problem.

Hi Larry,

Okay, after performing literally hundreds of vehicle/fleet installations I think if you follow the following recommendations' you won't go wrong.

First, grounding. All exterior openings such as the doors, trunk/boot, hood/bonnet and even the fuel filler door must have at least one well attached grounding strap from the body to the item you are grounding. I attach two per door, one at the top hinge and one at the lower hinge. Two straps on the hood/bonnet, one near the left hinge and one at the right hinge. So on and so on. I also use a quality copper paste or metalized Never-Seize paste between every attachment point. This maintains a good conduction and minimizes corrosion.

Next you will need to lift the car so you can attach at least four straps. Both sides and front and rear body mains to the chassis. You should also ground the bumpers to the chassis and then you must ground the exhaust at, at least two places. One near the joining of the exhaust header to the pipe and at least one at the exhaust tail pipe. Additionally, you should attach at least two straps to the engine. One from the area of the starter the other from the upper area near the injectors if so equipped.

To restrict high pass noise as from Cooling Fans and A/C Blowers you should attach a good quality DC Filter to the main DC feed line to your radio(s).

Lastly you should install Clamshell Ferrites at the termination points of all connections to the radio, Power, Speaker and Coax.

With these methods' I have achieved a nearly flat Signal to Noise ratio across the band. I can even work HF while driving down the road.

I installed a Kenwood 742A, an ICOM 706MkII and a Uniden 795D in my Nissan Van. the radios are all mounted under the drivers seat with the control heads mounted on the dash just in front of the A/C center vents.

I mounted my AH-4 to the rear drivers side wall/bulkhead just behind the third row seat and the output feed line runs under the wall to the Ball-Mount installed about 16 inches away. Note that I converted the open feed line output to a PL239 chassis connector allowing me to use RG-8 with standard PL-259 connectors. That way I have no concern for shorts or hands touching the connector while transmitting. It also allows me to easily connect an external Field Antenna when running in the field if I need to.

Long answer to a short question, hope it helps.

Best of Luck & 73,

Dave S.

Thanks Brock,
i don't have a manual but i can download one from
BAMA i think under heathkit.
I'll do that, i was hoping it was just a matter of a jumper or
something easy like that :-)

# 18755. Factory set TX power

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-13 03:20:10 UTC
From: Glenn Corrie
Topic: 18755  Message: 18755

My IC-706Mk2G is less than 12 months old and this situation has been with the unit since new I'm not sure if this problem is unique to myself or if others have experienced the same?

TX power output on FM for 2&70 is lower than I expected

- max setting for 2 meters is only about 30Watts

- and 20Watts for 70cm

- Measured using my Revex SWR meter

- Antenna SWR is less than 1.5:1 on both bands

- Power supply delivers 13.82v

I must admit I haven't checked the power levels on SSB.

Is this a common thing was ICOM being kind to their PA's out of the factory?

I assume the problem is easily fixed with the TX power adjustments that are readily available and published on the internet

Have experienced the same?

Regards,

Glenn Corrie

Hi Floyd,

Fancy meeting you here, didn't know you had a 706, pretty cool. We should get together and compare notes sometime, maybe at the next club meeting.

I agree in the use of ferrites and as you, I prefer the clamshell type. I used to get mine at Gateway, now closed of course. As I recently exhausted my remaining supply I have been looking for a reasonably priced supplier, might you have any suggestions'?

hi.

I had a similar problem with mine..I traced it down to the relay that is beside the fuse in the pa section...there is a voltage that comes off the PLL brd that keyed that relay circuit..I found that there was electrolytic cap that is glued in free space was defective...I have also heard of ribbon cable issues... If you need a service manual I found mine on Repeaterbuilder.com under the Icom section..

hope this helps

From: Saunders, Tom
Topic: 18753  Message: 18761

Hi KB, Check the pins in the power connector. If they get spread a little too far, they may get resistive and the radio won't see the full power supply voltage, and the relay will chatter as the radio tries to turn on. A sharp pointed tool can reach inside the open end of the connector and a little pressure applied will close up the contact pins for a tighter fit. Hope that solves your problem.

Yes John you are correct

I was thinking what the value should be when I typed this email, not what I'm actually achieving!

Lets try again ...

- I'm only getting 30W for 2M (should be 50W)

- 10W for 70cm (should be 20W)

FM of course!

Subject: [ic706] Factory set TX power

My IC-706Mk2G is less than 12 months old and this situation has been with the unit since new I'm not sure if this problem is unique to myself or if others have experienced the same?

TX power output on FM for 2&70 is lower than I expected

- max setting for 2 meters is only about 30Watts

- and 20Watts for 70cm

- Measured using my Revex SWR meter

- Antenna SWR is less than 1.5:1 on both bands

- Power supply delivers 13.82v

I must admit I haven't checked the power levels on SSB.

Is this a common thing was ICOM being kind to their PA's out of the factory?

I assume the problem is easily fixed with the TX power adjustments that are readily available and published on the internet

Have experienced the same?

Check the Santee swapmeet just down the row from the clubs space on the first Saturday of the month. The Gateway guys are now San Diego Electronics in Kearny Mesa and may still have some ferrites. Take care.

Hi Floyd,

Fancy meeting you here, didn't know you had a 706, pretty cool. We should get together and compare notes sometime, maybe at the next club meeting.

I agree in the use of ferrites and as you, I prefer the clamshell type. I used to get mine at Gateway, now closed of course. As I recently exhausted my remaining supply I have been looking for a reasonably priced supplier, might you have any suggestions'?

Hi Dave and Larry.
I just wanted to add that I have found it helpful to install clamshell ferrites to the feeds to the injectors also.

Hi Larry,

Okay, after performing literally hundreds of vehicle/fleet installations I think if you follow the following recommendations' you won't go wrong.

First, grounding. All exterior openings such as the doors, trunk/boot, hood/bonnet and even the fuel filler door must have at least one well attached grounding strap from the body to the item you are grounding. I attach two per door, one at the top hinge and one at the lower hinge. Two straps on the hood/bonnet, one near the left hinge and one at the right hinge. So on and so on. I also use a quality copper paste or metalized Never-Seize paste between every attachment point. This maintains a good conduction and minimizes corrosion.

Next you will need to lift the car so you can attach at least four straps. Both sides and front and rear body mains to the chassis. You should also ground the bumpers to the chassis and then you must ground the exhaust at, at least two places. One near the joining of the exhaust header to the pipe and at least one at the exhaust tail pipe. Additionally, you should attach at least two straps to the engine. One from the area of the starter the other from the upper area near the injectors if so equipped.

To restrict high pass noise as from Cooling Fans and A/C Blowers you should attach a good quality DC Filter to the main DC feed line to your radio(s).

Lastly you should install Clamshell Ferrites at the termination points of all connections to the radio, Power, Speaker and Coax.

With these methods' I have achieved a nearly flat Signal to Noise ratio across the band. I can even work HF while driving down the road.

I installed a Kenwood 742A, an ICOM 706MkII and a Uniden 795D in my Nissan Van. the radios are all mounted under the drivers seat with the control heads mounted on the dash just in front of the A/C center vents.

I mounted my AH-4 to the rear drivers side wall/bulkhead just behind the third row seat and the output feed line runs under the wall to the Ball-Mount installed about 16 inches away. Note that I converted the open feed line output to a PL239 chassis connector allowing me to use RG-8 with standard PL-259 connectors. That way I have no concern for shorts or hands touching the connector while transmitting. It also allows me to easily connect an external Field Antenna when running in the field if I need to.

Long answer to a short question, hope it helps.

Best of Luck & 73,

Dave S.
W6BTS

# 18766. IC-706 Detachable front panel

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-26 08:11:38 UTC
From: yo4btb
Topic: 18766  Message: 18766

Good day to the group.
I am looking for a detachable front panel for IC-706(or706mk2), or only PCB(B4558G).
AF/RF/SQL,RIT/SHIFT,RIT pressbutton&led have no actions.
Flat cable from inside was replaced with new one but no changes.
Replaced with detachable front panel from IC-706mk2g, my transceiver works good, that i think my detachable front panel have some problems.
Thanks in advance for any ideas.
Best regards from Romania.
YO4BTB,Virgil

# 18767. 706 MKii deaf on 2 meters

Yahoo group: ic706 (2010 — 2015)

From: Bob N3PPH
Topic: 18767  Message: 18767

I have a MKII that I have been using on HF without problems. I was trying to help out a friend with WSPR on 2 meters to find my radio has no sensitivity. We are about 10 miles apart and he pointed his beam at me and threw 1500 watts CW, I heard him barely, no s units. I read of a problem with MKI and coils but when I opened mine up no coils were close to the power plug. Has anyone had a similar issue with the MKII and more importantly know of a fix. I have had the radio a couple of years, was already opened for all band transmit when I got it.

I could be wrong, but I suspect that you just described the problem:

A station 10 miles away pointed his beam at your station and fired a 1500 W CW signal at your antenna.

Question for you: What do you think would happen if you connected a 500 watt transmitter directly to the antenna terminal on your 706 and then fired a 500watt CW signal directly into the radio????

Did you do this before or after you had the "sensitivity" issue?

Can I just check you had the right coax connected to the right socket?
if you had a HF antenna connected to the VHF socket you may still be able to hear the guy, even the crosstalk from the 2M on the other socket could lead to what you experienced.

No offence intended of course I have NEVER done this, (today anyway)

I'd start with some basic assumptions.
1 that you have disconnected everything (including Mic) and reseated the control head (removed the remote head cable if fitted)?

Maybe performed a reset (up-down buttons power on) beware WIPES ALL MEMORIES

then if it still does it from other post I would begin to suspect a welded relay but others will probable know if it is common.

Regards
Stu

A station 10 miles away would have no lasting effect on the 706.

I often run 500 watts on 2 meters to a beam on a 60 foot tower with one rig and have an Icom 746 pro hooked to another antenna that is somewhat lower but only 50 feet away.

At 10 miles there is about 100 db of loss on 2 meters.  Assuming around 10 db of antenna gain that leaves 90 db of loss.  Unless I missed a few decimal places that gives around .00001 watts or less at the recieve antenna or less.

Another thing that occurred to me this morning, being that you rarely use 2M do you use an external low pass HF filter? To be a good neighbour I always do but did find myself listening to a completely "dead" 6M band the other day until I remembered.

The fact the rig has been opened up should not really affect the 2M sensitivity as most receive mods seem to enable the 2M pass filter where it would not normally be enabled.

The fact you could actually get something makes me think the front end is working but maybe the signal is being stopped by something else, if it was a blown front end you'd probably need hundreds of millivolts rather than a distant station no matter how loud. Still possible if it has suffered bad abuse or serious static/localised lightning hit.

If you have an antenna tuner use that as a signal source and limit the connections external to the rig to just a whip (on a mobile mount) and then see if anything at all affects it.

OK on the antennas, sorry had to ask.

G'day Bob.

Did you try transmitting on 2 m to your friend as well? If not, confirm that the transmit side of 2 m is working. If it is not, perhaps the 2 m PLL voltage is outside the specification, taking out 2 m completely without affecting the HF side of the 706.

Don't you just love it when numbers can be used to redefine the scope of the question?

Path loss is 100% very real. The divergence, that is 1/R^2, of the radiated power per unit wavelength over the path length convinces the owner that the problem, which is very real, is somewhere else.

Subject: Re: [ic706] 706 MKii deaf on 2 meters

A station 10 miles away would have no lasting effect on the 706.

I often run 500 watts on 2 meters to a beam on a 60 foot tower with one rig and have an Icom 746 pro hooked to another antenna that is somewhat lower but only 50 feet away.

At 10 miles there is about 100 db of loss on 2 meters. Assuming around 10 db of antenna gain that leaves 90 db of loss. Unless I missed a few decimal places that gives around .00001 watts or less at the recieve antenna or less.

I have not read the whole thread, but at 10 miles mutual antenna heights become critical to operational path length.

A 100 feet high tower has a VHF/UHF radio horizon over 'smoothed earth' of 10 miles. A 50 feet high tower has a horizon of about 7 miles. Earth scattering effects will add a few additional miles. If both stations have an effective antenna height of 30+ feet then a 10 mile path should be achievable.

Also, antenna gain is offset by coax line losses which can be significant at VHF/UHF. One hundred feet of high quality foam dielectric will have 2 to 3 dB loss in a matched system. Solid dielectric will have higher losses. And, the losses get worse when VSWR exceeds 1.5:1.

If you really want to measure the weak signal performance of your radio, use a calibrated signal generator.

DD, W1MCE

That was done after the fact. We were trying weak signal and I could not receive. We then went to 10 watts still nothing. He just did the blast to see if I heard anything at all. This was my fist time ever trying 2 meters with this radio.

From: John Geiger
Topic: 18767  Message: 18781

On the 706 original there is a small set of coils right below the power plug that cover 2m receive. If you are not careful hooking and unhooking the power cord, you can damage the coils, knocking out the sensitivity on 2m. I had a 706 with this problem. Not sure if the same design is used in the MKII or not, but it might be a place to start checking.

G'day Bob.

Did you try transmitting on 2 m to your friend as well? If not, confirm that the transmit side of 2 m is working. If it is not, perhaps the 2 m PLL voltage is outside the specification, taking out 2 m completely without affecting the HF side of the 706.

Especially if there is not VHF antenna installed..... =)

Sorry. You did say that you had only used HF to that point. Just wanted to start at the simplest issue first and you didn't mention the antenna at all and, since these thing do need a separate antenna for VHF,..... Have you checked it and its connections?

God bless

OOPS! There it is. Didn't get that far in my mail. Sorry!

It still sounds like an antenna connection issue. Do a continuity check on your coax maybe? Connectors not soldered well? Usually, though, you'd get some RX and TX would be the pits.

Trying to think of a setting that would affect the VHF and not HF.....

Anybody?.....Beuller?

God bless

# 18785. IC 706 stuck in transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-27 20:46:28 UTC
From: Tony D.
Topic: 18770  Message: 18785

Be sure you dont have anything plugged into the RTTY Jack. I have a MKIIG and have my computer hooked to it...accidentally...not paying attention....I plugged into the RTTY Jack instead of the correct port {CI-V Remote Control Jack}.  Seems it was transmitting when I turned the radio on!
I hope this helps.

Have a GREAT DAY !
God Bless America

# 18786. RE: [ic706] IC 706 stuck in transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2011-04-27 21:09:51 UTC
From: Warren, Edward F
Topic: 18770  Message: 18786

I had a similar problem with a mobile installed IC-706 MkII - but it was intermittent. The radio really wasn't transmitting - it was as if the PTT were depressed - enabling transmit. RF output would occur if you spoke into the mic on SSB or started keying on CW. Another strange anomaly was that if you tuned the rig into a band segment where amateur transmitting isn't allowed (such as 10 MHz WWV) it would drop back into receive mode.

It happened even if everything but the DC power was disconnected. No mic, key, headphones, antenna, etc. It didn't seem to make any difference whether the engine was running or not, hot vs.cold, driving or parked. Although I could rule out a number of factors, I could never cause it to occur. Being intermittent made it difficult to isolate.

Unfortunately, I don't know the solution to this problem. Perhaps someone will recognize these symptoms and give us both a tip.

I want to thank all that replied. Stu M0AQY and I have been exchanging direct emails and think we have pinned it down to alignment of VHF coils L60 and L62. I have a close ham club and am going to see if one of the members might have the proper equipment to align the radio.

I have had exactly same problem (and temporary cure - switching to VHF and Tx then return to HF with full power) and never discovered the fix. What I did find is the RF drive going into the PA stages is the level that drops off. So its not a TxRx relay or band filter or driver/finals problem.

Hi Pat,

They are great radios for the price. I like mine and paid around $250 for it. The first secret is to use it to get on 6 meters. That is a great band and a simple antenna on that band will give you lots of fun. Also, adding a crystal filter to it will make a big difference on CW or SSB, depending on what mode you do the most. I added the 500hz CW filter to mine, but am thinking of getting the 350hz or 250hz instead. If you do mainly SSB the FL223 1.9khz filter will help.

Do you have the original model, or the MKII or MKIIG? The latter two take 2 filters, the original only has one slot.

# 18800. Dial inoperative?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-03 11:47:11 UTC
From: wb8ssb
Topic: 18800  Message: 18800

Hi All,

I've got a 706 that I haven't used for a while, and when I powered it up the other day, the display was stuck on a 40 meter frequency. Looks like all the various buttons work (up/dn, mode, etc,) but the tuning dial had no effect. I did a power up down reset, and now the frequency has changed to 14.0000, with the dial still not tuning.

Has anyone else run across a problem like this?

10 meters when it's open is also great; a little longer antenna for mobile use than 6 meters for sure, but you can get one of those 102" CB "whip antennas," cut it down a bit and there you go.

Even Techs have USB privileges between 28.300 MHz and 28.500 MHz, and I've worked Argentina and other DX on 10 meters with a simple dipole mounted only 15 feet off the ground.

10 meters is a great way to get introduced to HF, and it convinced me to upgrade to General.

And we are 2-3 days into what is usually the best month for 6m.
Mobile a 48" whip and 4" spring will usually do it.

I don't suppose it's the lock button?

What about when you try to change a menu setting? That should tell if it's not working at all?

If that one has the removable head I'd go ahead and try cleaning the contacts with q tips and alcohol.

Good luck

I might mention also that for USB there is a call channel. 50.125 USB
50.140 is pretty popular as well.
Activity usually between those two unless it starts getting crowded. A lot of scanners are programable for these frequencies and although scanners are fm they'll make noise.

Repeaters and fm farther up the band.

# 18808. RE: [ic706] 706 MKII operational help

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-03 21:37:05 UTC
From: Joe Ames W3JY
Topic: 18806  Message: 18808

I owned mine for years as a base station/portable xcvr. But it was only when I placed it into mobile operation that it suddenly made sense and I appreciated the true genius of its design and functionality.

I didn't realize the layout is designed for right-hand mobile operation. The band switch, drag adjust, tuning steps, etc are perfectly placed for that. So too are the soft menus: For example, memory names, filter and DSP are on separate "turns" using the menu button. They make a natural grouping. So too the other functions - they are all spread through the menu structure logically, according to typical use scenarios, making it very easy to select the function you need at any given moment.

The other tip is to configure memory channels according to your operating habits, otherwise you'll spend a lot of time scrolling through them all the while, your eyes are off the road.

GL!

Ask away, this list is pretty quiet as opposed to the mk2g one.
You might mention which mode or hf,6,2
To narrow things down a bit.
On repeaters you have to make sure the mode is FM-T, sometimes if you bump the vfo it will knock the "t" off.
Personally on ssb, I run the mic gain and alc a little higher than recommended and get good unsolicited audio reports using a heil traveller headset. The stock and DTMF mics work well too.
I have a mk2 and mk2g. They used to be my primary rigs until Santa Clause came in December.

Hello Pat,

I recommend the narrow SSB filter too, it can be a great help. One of the other filters may also be useful depending if you use CW or other modes.

The built in DSP (if your model even has it) leaves something to be desired though. Generally only the first 2-3 levels are useful; beyond that it's too distorted. However the automatic notch filter is quite nice.

I would recommend the CLRspkr DSP speaker, from West Mountain Radio. I have its predecessor that was made by another company a few years ago. This will make a lot of difference and is well worth it.

Nope, not locked (or at least the lock indicator goes on and off as I push it).

I just toggled through all the other buttons on the front panel and they all appear to function correctly.

Interesting thought on the lock button though. Perhaps somehow the lock is active all the time, even though the indicator LED is showing that it's toggling back and forth.

The lock indicator toggles on and off when I push it. No effect on the knob not functioning.

I just went through all the buttons and they all seem to work as they should.

Perhaps the lock is on all the time, even though it's indicating it's changing states??

Have IC-706MKII for sale. I have used it mobile. It works fine and power output is within specs on all bands. Has DSP installed. Comes with microphone, power cable, separation cable, original manual, original box. Price : $575. Also have a PS-125 AC power supply for sale for $225. Both for $750. Buyer pays shipping from zip 22554 or pick up off exit 143B of I-95 in Virginia. Have several ham sticks for sale too.

Have IC-706MKII for sale. I have used it mobile. It works fine and
power output is within specs on all bands. Has DSP installed. Comes
with microphone, power cable, separation cable, original manual,
original box. Price : $575. Also have a PS-125 AC power supply for
sale for $225. Both for $750. Buyer pays shipping from zip 22554 or
pick up off exit 143B of I-95 in Virginia. Have several ham sticks for
sale too.

I did have the mobile mounting bracket and will look for it. If I still have it I will include. Most recently I mounted the head directly on my console using double sided tape. Worked great.

Larry,

Is this something different that holding the up and down buttons when powering up? I've tried this a number of times with no change.

# 18825. Re: Dial inoperative? - UPDATE

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-05 22:47:28 UTC
From: wb8ssb
Topic: 18800  Message: 18825

Interesting enough, I hadn't tried to use the handheld mike. When I try the up and down buttons on it, I get the frequency incrementing (like the dial should be doing).

Weird.

>
> Hi All,
>
> I've got a 706 that I haven't used for a while, and when I powered it up the other day, the display was stuck on a 40 meter frequency. Looks like all the various buttons work (up/dn, mode, etc,) but the tuning dial had no effect. I did a power up down reset, and now the frequency has changed to 14.0000, with the dial still not tuning.

It's an original 706. According to the manual, the reset for the CPU is the power /up down press. When I do that, it defaults to 14.1000 USB, which is what the manual says should happen.

Hi All,

Okay, I've been watching this discussion waiting for someone to recommend what should have been the obvious, I thought...

Break this down to "Inputs and Outputs". Up to now you have exhausted al of the menu/user options to resolve this issue.It seems that Harry has found that in fact the tuner is in fact still working as he is able to adjust the VFO via the microphone controls, (Input/Output). The issue is that the Main Dial is non-functional although the radio seems to be fully operational otherwise.

At this point you need to examine the internal connections of the Front Panel/Control Head Interface. As an extension of that the Front Panel may need to be opened allowing the inspection and repair of the fault.

So back to Inputs and Outputs. The input is that manual manipulation of the Main Dial. The output would be adjustment to the VFO. As we know the VFO is working the diagnosis has to be narrowed down to the connection interface and then further into the Main Panel right up to the possibility of a failure and/or a cold solder joint at the VR/POT (S1(FR)) that detects rotation of the Main Dial. However, as I recall the radio had not been used for some time and baring any possibility of specific damage from static or over voltage I would suggest that the possibility of oxidizing of the connection points be suspected. There are a small number of connectors, twist cables, ribbon cables and pressure contacts that could all be suspect. In actuality is a very doable inspection and if you take care and respect the logic of how the Front Panel disassembles you will be able to successfully open and inspect the entire unit within 30 minutes.

Again, in my opinion you have exhausted all the "easy fixes" available. You must bite the bullet, break out the hammers and get your hands dirty. It should be an easy fix once you have located the fault it's just the finding that may be daunting. Look at the connections and wires then move on to the solder joints. I'm sure you will find the fault in the Front Panel and you should be on the air in no time after that.

Best of Luck & 73,

Dave

I hear what you're saying Dave. I've got the exploded diagram for the front panel and the schematic, and am planning on opening up the front panel this weekend. I'm seeing that the dial connects to the CPU on the panel through a few gates, so don't expect it to be too difficult to find.

I was sort of hoping there would be some sort of issue that had been identified already. Reminds me of my old RCA days where I could always find something new for the engineers to ponder over :-)

Will post my results later.

73,

Ken

I suppose you mean top cover...they are M2.5 x 0.45 F90
If you get the Hex type (Allen key 1.5) they are easier to manipulate.

You can program the USB mode into the memory channel, but not the power level. So, when going to the memory channel, either lower the power manually or use an antenna that has a 3db loss relative to a dipole.

Well Rick, it will not be stereo, but I believe there is a switch on the back side of the control head that might do what you want (put audio to both ears).

Subject: [ic706] No Stereo using headphones front panel jack

Trying to listen to HF with my stereo headphones pluged into the front panel PHONES jack. The sound comes out on 1 ear only. Is there a setting to produce 2 channel stereo? Or is it mono only?
TNX in advsnce for any help.

# 18841. IC-706 Detachable front panel

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-14 08:09:30 UTC
From: yo4btb
Topic: 18766  Message: 18841

My ic-706 have some problems as follow:
- AF,FR/SQL,RIT,SHIFT - no action
- RIT taste - Led not light,no action
- SQL - high level on VHF band
- flat cable from VR unit and PCB B4559B was replaced with new one - no changes
- detachable front panel was replaced with one of ic-706mk2g - my transceiver works normally
- ic-706mk2g with my detachable front panel not working.
After this i think that my detachable front panel is not in good condition.
Thanks in advance for any help/ideas.
Best regards.
YO4BTB,Virgil

# 18842. Re: [ic706] Does the 706 mk2G support 60 meter operation?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-14 14:02:23 UTC
From: Deacon Dave
Topic: 18836  Message: 18842

The 706MKiiG as delivered by the factory does NOT include the 60 meter band [5 channels].

However, the 706MKiiG can be 'opened up', using the MARS Mod, and then will support the 60 meter band. The mod is available at www.mods.dk. I have poor eyesight and 73 year old hands. I had the mod done 5 years ago by a local electronic tech who is skilled in working with SMD diodes.

The filters for the final amplifier are sufficiently wide to accommodate the 5.3 MHz frequencies when 40 meters is chosen.

As mentioned in another response, simply program the frequencies and USB into memory, select an antenna and or power level to satisfy the 50 watt requirement and have fun.

Subject: [ic706] Does the 706 mk2G support 60 meter operation?

New user of 706MK2-G..Found by toggeling the up down band switch that their is no 60 meter frequencys. So is it possible to program all
5 of the authorized frequencys into 5 memory channels? Including 50 watt power level and USB mode?

Rick, yes in part.
you can store the freq info in memory as I do that as well but you would
have to adjust the power out as needed.

Thanks for the info John. I will enter all 5 of the freq channels and put them in memory.
If I may, I would like to ask you another question.
Does the 706 have  Moni mode so one can listen to their own transmit audio with headphones?
73,
Rick ND4Z

You can program the USB mode into the memory channel, but not the power level. So, when going to the memory channel, either lower the power manually or use an antenna that has a 3db loss relative to a dipole.

TNX Tom,
I removed the front panel and the switch was on Speaker, I mover it to Headphones and now have both sides of my headphones working.
Now I can't find out how to get "MONI Fuction" on to monitor my transmit audio.
Any suggestions?
73,
Rick ND4Z

Well Rick, it will not be stereo, but I believe there is a switch on the back side of the control head that might do what you want (put audio to both ears).

No, it doesn't have a transmit monitor. I don't think any of the HF/VHF/UHF mobile style rigs do, with maybe the exception being the Icom 7000. The Yaesu FT450 does, but that is a feature rarely found in the cheaper radios.

So what is the point in using a dtmf mic on the 706? Possibly for echolink or IRLP commands. A disadvantage I can see is the $75-$100 it will cost you.

Even if you have a cell phone, depending upon where you live, there's no assurance it will work at all times, or will work in a time of emergency.

I live in the mountains of SW North Carolina, right on the GA/NC border. If I head east toward Asheville (about 100 miles NE of my QTH), I'll go over a mountain plateau between Hayesville, NC, and Franklin, NC, where there is NO cell phone coverage for 10 - 15 miles. However, there are several 2 meter repeaters on nearby peaks that can be hit with mobile 2 meter rigs or even HTs.

Plus, even down in the valleys there are areas where ridges and other terrain "shadow" cell phone signals from the scattered cell towers in this area (due to the relatively low population base, companies like Verizon Wireless, AT&T, etc., don't "dot" the landscape with cell towers). Cell phones won't work where the signal can't get out!

This Saturday, I and a number of hams are providing radio comms for a 100 mile bike race in this area where there rest stops can't get cell coverage.

Those folks who are "metro-centric" in geography, thinking, and commentary, fail to realize or take those facts into account.

Plus, in times of emergency, when everyone starts hitting the cell phones, it quickly overloads the circuits, from what I've read, so even metro areas may have failures in cell coverage.

Maybe the repeater groups ought to keep those autopatches in place!

We have the same problem with cell phone coverage here in Oregon.  Many of the cell phone towers will not cover the roads to the coast,too many twists and turns thru moutains and valleys .  However the same is not true with two meters or 440 with the sites on the mountain tops,true that there are some spots that is not covered by 2 mteres,but they are fewer than on cell phones.
  Ham radio will come thru where commercial equipment fails.

From: Larry J. Ford
Topic: 18833  Message: 18861

One major difference between the commercial cell phone companies and amateur radio repeaters is that the cell phone companies simply will not put a cell tower if there is not a sufficient present (or future) subscriber base to support it, regardless of whether it leaves gaps in coverage areas.

However, a group of hams will get together and decide to put a repeater on a mountain top just because they have fun doing it and want to cover a specific area.

Plus, it costs between $500,000.00 and $1 million to put up a "standard" cell tower (not one of the monopole variety), depending upon location, site costs, etc. (direct quote from a Verizon Wireless engineer, who is also a ham).

The hams can generally scrounge-up enough equipment to make one work for less than $500.00 in most cases. One of my "Elmers" had way less than that in his repeater. Of course, he "home-brewed" the controller, etc.; it wasn't "pretty," but it worked!

Not to mention that, if you forget to make a payment, your phone company will shut you off. Most repeater owners welcome the use of their repeaters by passersby and such. They're kind of strange that way. Don't they know they are supposed to be living in the ME generation? =)

Really, one of the things that endure me to this hobby is the attitude of building up, teaching and encouraging others. A foreign concept in most of our society today. Sure hope that nature continues as younger folks take interest in the hobby.

God bless

OK, all good comments, but before the moderator steps in, we're getting far afield from the original post about whether the HM-154T DTMF mic would work with the IC-706.

Suffice to say that it does, and despite the protestations of some on this list, there may be very good reasons to have one with your 706!

# 18867. 706 Issues.

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-22 11:56:33 UTC
From: n0sya
Topic: 18867  Message: 18867

Hi group, have some trouble with a 706 original flavour and would like your input if you have seen such behaviours before.

1. At power on, no audio out is most often the case no matter what speaker is used, internal or external or headset, but not always - sometimes audio is present at turn on. If one employs the band scope, after a few minutes of relay clicking band scoping the audio returns and stays untill the next time you turn the 706 on.

2. Another issue is that there is progressively less rf out on hf as you go down in freq. At 10m full output, 20m about 50w, 80m around 10w or so. Swr into a known good 50ohm load and into an autotuner reads high or infinite on the bands where power is reduced.

If anyone has seen this kind of stuff before, please let me know what was done to remedy it.

73!

Chris

My 706 MKII took a 2 foot nosedive from a shelf. The landing was soft, but not soft enough to prevent the latch from breaking. Two very small pieces of black plastic broke off and basically disintegrated. As a result, the face plate slips off without pushing the latch. There is no "click" when it is put back on the radio.

Any solutions? Thanks, Tim K0PG

Subject: [ic706] Deatchable Face Plate damage

My 706 MKII took a 2 foot nosedive from a shelf. The landing was soft, but not soft enough to prevent the latch from breaking. Two very small pieces of black plastic broke off and basically disintegrated. As a result, the face plate slips off without pushing the latch. There is no "click" when it is put back on the radio.

Any solutions? Thanks, Tim K0PG

Hi Tim,

you can order the replacement parts from Icom for a couple of bucks. They are easy to fix, they must be, because I fixed one.

Same damage happened to mine and a buddy's, bought parts through Icom.
The parts and shipping was less then 10 bucks.

From: Larry J. Ford
Topic: 18878  Message: 18879

What model 706 do you have, and what digital modes are you looking at?

If it's a sound card digital mode, then, yes, you will need an interface between the 706 and your PC. I also have a 7200 and it has a built-in USB port which "emulates" a sound card for PSK-31, and other sound card digital modes. All the 7200 needs is a USB cable between the rig and the PC.

However, the 706 (any model) is not so equipped and does need an interface for sound card modes.

For other, non-sound card digital modes (Packet, Pactor, etc.), you'll need a TNC with the proper cable to the rig.

I'm no expert on any of this, and just beginning to explore this modes for the 706 myself. I bought the 7200 over a year ago because it was so easy, relatively speaking, to get on the HF sound card modes.

Hope this helps.

For simple PSK31 type digital modes, not really. Just a couple audio cables between the rig and the PC will do. You'll have to use an attenuator in the line to drive the mic jack (possibly in both directions depending on the sound card if the RX audio overdrives it), and you can use VOX to key the radio. If you want to go with keying from a COM port (or USB serial emulator), you can build a very simple interface attach to the radio at the 13 pin DIN acc'y jack. I run that type of interface -- the plans should be in the files area of this group. Built it with junk box parts.

# 18881. RE: EXTERNAL: [ic706] Interfaces

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-25 14:45:11 UTC
From: Lefczik, Larry D
Topic: 18878  Message: 18881

One of my favorite questions.

I have used acoustic coupling for digital AFSK digital modes with good success. That is. I have the 706 mic near the computer speaker and the computer mic near the 706 speaker. I used the 706 VOX for keying for transmit. So the answer NO, you do not NEED an electrical interface between the rig and the computer. But, beware of background noise in the shack that will go over the air if picked up by the 706 mic. Remember, you are in the "data" potion of the band where voice is not permitted. Also, you may quickly get tired of listening to the sound of AFSK after a few hours.

The computer can be directly wired to the 706 to interface the audio tones. Again the 706 VOX, when properly set, can key the 706 or you can use a footswitch or any PTT. The key here is to attenuate the audio into the 706 enough to not overdrive the 706. I use a simple potentiometer tin line, some use a fixed voltage divider resistor network. There is a risk of ground loop noise reported by some. I have not experienced that, maybe because I used a laptop. They have solved it by adding isolation transformers on the audio lines.

There is no NEED to buy a commercial interface for the digital modes, but many operators use them for convenience.

Set up with any interface is
1) back off the RF output from the 706 because of the high duty cycle to save your finals
2) start with low audio input to the 706 and increase but be sure to prevent clipping and splatter
3) adjust level to computer to prevent clipping of your sound card per the software's instructions

Enjoy,
NJ2L

Good stuff. Forgot about this.

What you're describing will only work for sound card modes, I believe.

I guess you could just stick a microphone up to the rig's speaker and vice versa if you wanted to be really simple for PSK-31, right?

The original poster didn't specify which digital modes. As I posted earlier, a TNC will still be needed for Packet, Pactor, or similar modes, correct?

I have put a laptop next to the speaker of a low band rig and copied many of the sound card modes to demonstrate that to other hams.  I would not recommend using a microphone as the input to a low band rig as mentioned you are in the digital part of the band and anything picked up by the mic other than the digital signal would not be legal.  Guess that you could use it in the other parts of the band such as where slow scan TV is used as voice is legal there.

Well, I don't do either as I use a USB connection from the laptop to my IC-7200's USB port for PSK-31 and other modes.

I was merely speculating as possible methods as others had posted to the effect that no interfaces were needed to put the 706 on digital modes.

# 18892. 2m rx/tx problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-26 02:26:37 UTC
From: n4eyz
Topic: 18892  Message: 18892

I have a rx and tx problem with a mkIIG. Background noise goes up terribly just on 2m and sounds like loose ant connection. Also sounds remarkably like sitting in my truck in a hard rain downpour. Affects tx as well. Antenna is not the problem as it does it on any 2m antenna. The problem starts after the radio has been on for a few minutes and comes and goes. Temp of the radio seems to make little or no difference. No other bands affected. Anyone have any ideas? Been out of the hobby for a bit--any recommendations on best repair facility?

Wayne/n4eyz

G'day Dave.

I'm also a new 706 user, and can tell you a lazy (and very quick!) way to get into PSK31....

CI-V cable from eBay
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=120643868573

Tigertronics SignaLink USB and interface cable from DXEngineering
http://www.dxengineering.com/Parts.asp?ID=2334&PLID=277&SecID=135&DeptID=42&PartNo=TIG-SL-USB
http://www.dxengineering.com/Parts.asp?ID=2324&PLID=357&SecID=135&DeptID=42&PartNo=TIG-SL-CAB13I

HamRadioDeluxe (V4) controls the Icom (and it's free!)
http://www.ham-radio-deluxe.com/

DigitalMaster 780 (DM780) from within HRD
http://www.ham-radio-deluxe.com/Programs/DigitalMaster780.aspx

Absolute total time from delivery to first completed DX PSK31 QSO (including setting up macros) was less than an hour.

HTH,
Chris
VK5SA

I would not recommend using a microphone as the input to a low band rig as mentioned you are in the digital part of the band and anything picked up by the mic other than the digital signal would not be legal. Guess that you could use it in the other parts of the band such as where slow scan TV is used as voice is legal there.

# 18897. Cleaning up faceplate knobs

Yahoo group: ic706 (2010 — 2015)
Date: 2011-05-26 19:40:51 UTC
From: John Geiger
Topic: 18897  Message: 18897

I have an Icom 706 original I picked up a couple of months ago. Yesterday while taking it mobile I realized how dirty the knobs are on it. Usually it sits in the semi-dark shack and I don't notice such things. There is some sort of hardened gunk in the grooves on the volume and RIT knobs. Not the end of the world but would like to clean it up, if possible. What is the best cleaner to use on plastic knobs such as this?'

Hi John and others,
  First remove the knobs from the radio.  I remove them one by one,and when done with it, replace it ..one by one.
then I take a small container such as a "Glad" or "Zip Lock " and about a tea spoon of dish soap,and put that into the container with water about half full, out the knob into that and let it soak for about ten minutes or so,and then I get an old tooth brush that I keep in my desk drawer ,and brush the "gunk" out of the grooves.   Dry it off ,and do the next one.
The tooth brush should be a soft bristle one.
It's fun to see what others use for the same solution to  similar problems.

The knobs should be removable, and I would use mild soap and a toothbrush. Thats what I have used in the past for other "projects". I use Dawn because it is a grease cutter.

Are you sure it is not the antenna connection, coax, mount? Remember that the entire antenna system needs to be good. Are the symptoms the same with and without the engine running?
What about 70cm (common connection)?

I use Away LOC. Soak for 10-15 min. Toothbrush. Rinse. Dry.
Be careful with degreasers - they can damage some finishes (especially laquer).

Let things soak. Time is better than abrasive or harsh chemicals.

Greetings,

No, I didn't specify which modes because I wanted to explore all options. My plan for the station is a 20m dipole, no tuner and QRP until I can get a 20+ amp PS. Im also working towards a tuner. I have very limited funds, and am wanting to do this with little or no expense what so ever. If I can run a line(both input and output) from the laptop to the 706Mk2 directly, that would be awesome. If not, then I will have to explore my options a little more, and possibly back burner this till next year.

I have heard of the VOX thing(mic to the computer speaker,etc), but don't think I would be lucky enough(no background noises) to get away with that.

I really do appreciate everyone's input and opinions on this matter. I welcome all ideas!

No only 2m is affected and follows the rig from truck to base install. Other 2m rigs on same ant are fine.

TNX Joe,

I wonder if ICOM can add it, will have to call them on Tuesday and
ask, only live about 90 miles away so driving up won't be to bad
and shipping it not to high if they can add it at to much of a
cost.

Is there any good reason why you can't use the 13 pin Accs socket?

I don't think it has discriminator out put (which I suppose you might need for high speed data) but everything else from the data jack is on there including including Tx/Rx switching and Audio In/Out!

There is also a splitter available if you have dual uses for the socket.

Regards

Kav

If you interface to the 706 via the FRONT mic connector directly from the computer, you can use the VOX to trigger transmit of the 706.

When I say directly, I would like to remind you that you probably will need attenuation of some sort into the mic input since it is hard to bring many computers audio out levels down to mic level audio. A simple potentiometer with the wiper on the 706 side should work fine. Since the mic line has 8VDC on it, you should also add a DC blocking capacitor (~0.01 to 0.1 uF) between the mic connector and the potentiometer to protect the 706 from shorting the DC to ground and to protect the computer sound card.

Hi Chris,
yes there is a hidden menu.

Enter adjustment set mode:
1 Turn power OFF.
2 Terminate the [REMOTE] jack with a 3.5(d) mm mini-plug.
3 While pushing [P.AMP/ATT] and [TUNE/CALL], turn power ON.

Needless to say. Don't change any settings, unless you know what you're doing.

Are you SURE you want to be mucking around in the service menu if
getting into it is this much of a challenge for you?

Hi Sigi and the group, thanks and yes that worked nicely in getting to the occult service menu. I had a mono 1/8th plug and shorted it together and hit the two buttons whilst powering on and presto, there's the secret menus! I was disapointed in the lack of adjustments, nowhere near as many as the mk2/mk2g and 7k, but it did allow for "calibrating the filter" and setting the s0 level via a 50 ohm load. The rest I did not fool with as they take a bit more test gear than I have on hand.

After "calibration" the 706 had reduced apparent xtal filter passband asymmetry, well worth the time/cost and effort. I had replaced the stock FL-30 2.4KHz wide ssb filter with an FL-70 2.8KHz wide filter, much more to my liking with its widey goodness, and a better shape factor to boot.

The FL-30 as installed was symmetrical from usb to lsb whereas the FL-70 was not, so wondered if there was a way around that mildly unpleasant artifact. Found that the newer 706s (and the 703 and many other Icoms) had a service routine that apparently aligns the 1st IF filtering with the 2nd IF filter and wondered if that would help in my case with an original recipe 706 and my issue: the much dreaded, highly agonised over xtal ssb filter asymmetry. Oh, the agony of asymmetry! Anyway, this dramatic mystery has been resolved thanks to the 706 group. Again, Thanks!

Mod edit.

I'm letting this one go as I agree with Jack about the risk of ruining the radio. Please don't let the thread degenerate into personal attacks and bitching.

Paul
List Owner.

---

Gunny,

zero Ohm is a short, a small bit of wire and a bit of solder.

But I as well would question as to why you would want to work on the radio given that the way you interact on here is that you know very little or nothing about repair or servicing a radio.

You can ruin a radio from the service menu to where it is not worth fixing very quickly, The user menus there is almost nothing that you can do to the radio that a good reset would not fix but in the service menu there is NO PROTECTION it thinks that anyone in that mode is qualified to be there and you can let the smoke out in big ways from the service menu.

# 18919. 706 and wwv@20MHz = cheap frequency alignment

Yahoo group: ic706 (2010 — 2015)
Date: 2011-06-10 12:23:52 UTC
From: n0sya
Topic: 18919  Message: 18919

Hi group!
I just wanted to hash over a simple master reference oscillator alignment method. Many already know how to do this without a frequency counter ready, but many freq counters are off freq! The sig from wwv at 20MHz is far more accurate than many consumer freq counters, to say nothing of circuit loading that will alter freqs when trying to adjust reference oscillators via the counter method.

To be sure, my original recipe 706 was only off some 80Hz to begin with, but that still bothered me with a rig so stable. I knew that it could do better.

Just fire your rig up (hopefully with the bottom case cover already unscrewed) and let it warm up, do some operating maybe. After the rig is good and heat stabilised tune to wwv at 20MHz, or 15MHz if 20 is not coming in well. Use a tuner or enable preamp if it helps you get a better sig at 20MHz. The higher the freq at wich you obtain a signal for tuning the reference oscillator, the less the margarine of error. I enable 1Hz tuning just because, but as long as you have nothing but zeros after the 15 or 20 on screen you should be ok. Now following your service manual, adjust the pot or inductor or cap or rocker arm as required for a zero beat in usb or lsb at whatever wwv frequency you have to work with. I find that offsetting the pbt control to hear the swish of zero beat very helpfull. Headphones also help.

After you get one sideband aligned to zero beat, everything else should be too, but you can always check your work. If you get it to within one Herz you are doing great. You can check between the various modes for zero beat but it will matter little once set to any of them. Some prefer to use cw mode and then reverse the sideband cw is rx'd from for this adjustment, matching the tones. Some also use a pc to do an even finer alignment by using a sound card app that displays audio frequency spectrum, but I am not that geeky. Well, ok, I am that geeky, I just don't care to use the pc method. Then place the covers back and flip the rig over. At this time you should be proud of your little 706 and yourself.

But you're not done yet. Ohhhh not by a long shot.

Get the rig good and hot by transmitting at full power for a bit into a dl or by actually talking to other hams on the air with it. Then go back to wwv and see what your new zero beat offset is. From upside down and no case bottom or cover plate on the adjustment circuit to rightside up and fully clothed, my 706 was 5Hz off. Off came the covers and whith the display locked 5Hz higher than wwv at 20MHz, I zero'd the reference oscillator again. This small effort was rewarded with a gentle swishing of zero beat at 20MHz when all covers are in place and the rig is right side up. Not too shabby for not having any NIST traceable test gear. Beat that, fequency counter!

Good tip and I'll try that on whatever we can get in the UK (which seems
less well equipped up that end of the frequency range)
I've tried the cw/cw-r thing but not much more.

One thing I'm not too sure on is getting hold of some "margarine of
error" would the "butter of uncertainty" work?

Regards
Stu

This seems to be a well kept secret or something. Once I figured out how to do it, I check all my rigs periodically. My TS950SDX and IC-7000 have TCXOs and are well within 1 Hz. The last time I "sanity checked" my 950 with the ARRL FMT, I was within 1/10th of a Hz!

Also, I use a slightly different method. If you have a second receiver, you can tune it to WWV on AM then zero-beat the rig being adjusted to it using the audio tones. I use speakers on both rigs. I've also done the sound card spec an method with good success. Using the storage function, I store the trace of the tone locations with the rig in AM then adjust the rig in SSB so they overlay the stored spike. It usually takes some finagling to get the sound card spec an zoomed in & sampled enough to be accuate, but it works pretty well. Still, I prefer the method of zero-beatingaudio tones. Just as accuate and much simpler.

Hi Joe, yeah the am and other rx method I have considered before but never tried, glad to know it can work out. And yeah the audio specan is a bit more involved than I care for, but if you're already hooked to the pc, might as well go full geek on it. Some guys may need the overkill for some of the crazy digital modes.

Hi Stu, yeah, the butter of uncertainty goes quite well with the toast of the 706. And I am certain you said that on porpoise!

Hi Bruce, Thanks for that on checking availabilaty 10 week wait so may not bother with it
just uise HF. Don

# 18929. Frontpanel MKIIG with MKII changeable?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-06-26 11:50:06 UTC
From: dajetzi
Topic: 18929  Message: 18929

Hello,
anyone knows if the IC-706MKII frontpanel
can be used on IC-706MKIIG radio?
I dont know the differences between this radios,
but i assume the functions only provided from MKIIG
can not be handled from MKII panel.

73´s
Sigi

The answer to your question has been in this forum for a long time. One of the series is not interchangeable but the diagrams are available on the web. The control head is a separate diagram so just print out one of each and check the connections and voltage notations at the control cable plug. I do know the mistake costs the entire radio.

# 18931. No tx/rx on HF

Yahoo group: ic706 (2010 — 2015)
Date: 2011-06-27 15:03:04 UTC
From: wb4aeg
Topic: 18931  Message: 18931

I'm knew to the group and I'm sure this question has been addressed. I have no rx or tx on 160 thru 28Mhz. All works fine on 6 thru 70cm.
On HF I can hear the increase noise due to the preamp being switched in and out and I can hear the difference the filters make. I suspect there is a problem with the input switching. Any heads-up before I start troubleshooting? Hal, WB4AEG

I think the previous questions relate to MK2g compatibility with original Mk0 radios. I have both these models and there is no problem swapping the heads electrically. There is a difference in the way memory ch is selected and operation of RIT because the MK2g head has different rotary encoder here. DSP menus etc still operate in a radio that has it.

The MK2, I dont know. Its major difference is in the finals, which are bipolar devices rather than FETS in the others.

Ralph

# 18933. Icom 706 mkii (not g!)

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-03 18:43:48 UTC
From: wizzbit_99
Topic: 18933  Message: 18933

Hello there.
I have got the above radio.
I'm looking into getting into psk.
I've opened the radio only to discover that no optional filters are installed.
Would I need any to get me going or will the product below (also psk software) be enough to get me going?

http://www.ebay.co.uk/itm/DIGI-MODE-INTERFACE-SUITS-YAESU-ICOM-KENWOOD-RADIOS-/180688106644?pt=UK_ConsumerElectronics_SpecialistRadioEquipment_SM&hash=item2a11d9b494#ht_1077wt_1058

Anything else I'm missing?

Many Thanks

Mark

I am not familiar with that particular interface but it looks quite
nice. I have been running digi modes on my non G for quite a while.
There are times having a narrow filters helps but by no means is it
required. My filter is off more than it is on. Hope to see you on PSK soon.

# 18937. dead IC-706

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-13 13:03:01 UTC
From: Dihan Angelo
Topic: 18937  Message: 18937

hi

finally it happend... my 706 died!!!

can anyone please help me get the rig back online. the problems are as follows

1) HF Rx was dead. when you open squelch the RX indicator lights up but no (hiss) is heard. HF TX is ok.

so i packed the rig into storage and pulled out recently now the problems are as follows

2) HF RX and TX both gone. VHF RX was working nd TX was ok. but after a few QSO`s that too is dead.

VHF shows similar symptoms like HF. (when squelch open on VHF hissing is heard but no signal is received)

can any body help me pls.

# 18939. 706MKII doesn't power on

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-14 17:51:54 UTC
From: David Westbrook
Topic: 18939  Message: 18939

The IC706MKII has been great for my first 2 yrs licensed, but now it won't turn on!

* power cable fuses are both ok
* internal fuse (F2) is ok
* power supply is putting out 13.8V at terminals and connector
* When i look at components D12, D13, R35, it should be 13.8V (they're direct from power plug, before the power switch), but i only get ~3.3V (service manual page 78 has the diagram; can email me directly for the page or whole thing)

What do i look at next? Found several related threads in the archives where the issue was cleaning connections, PLL solder joints, or a bad cap. But i'm sure what to make of the 3.3V observation ... Is that a symptom of the problem (if so, what problem does it indicate), or am i measuring in the wrong place?

Unfortunately I'm a novice in electronics .. diagnositic equipment on hand is a multimeter.
I think this is my first post to this reflector, though I've been lurking for a while now and seen some good threads go by.

thanks in advance! (suffering RF withdrawal already!)

Check the power connector pins. They can spread apart inside the connector housing and cause poor contact with the mates.

I second what Tom has said. My 706 suffers from a similar malady. The pins in my power connector are a weak spot. Seems Icom could do better. Maybe they have by now.

# 18949. Re: [ic706] Serial number cutoff points

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-21 20:03:15 UTC
From: John Geiger
Topic: 18944  Message: 18949

Yes, they changed the type of finals used. The earlier models have finals
that can no longer be obtained so you have to change out the entire board
(or don't blow the finals).

# 18950. Re: [ic706] Re: 706MKII doesn't power on

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-21 22:35:04 UTC
From: David Westbrook
Topic: 18939  Message: 18950

I tried jiggling them while pushing power button, so if loose would maybe connect (even if briefly) ... Any better way to test or pinch them back tighter?

If the pins were the problem, i would see no voltage on the board (D12,D13,R35), right? Would loose pins explain the 3V i'm seeing (instead of 13V) ?

I think pins are ok, because D12/D13/R35 and the terminal on power supply is ok for continuity test.

Black terminal -> Red Terminal on PS is 13.8V
Red Terminal -> D12/D13/R35 beeps for continuity test
Black terminal -> D12/D13/R35 is 2.8V (!!!!!!)
Black terminal -> radio ground beeps for continuity test

==> So what's breaking the transitive property here (and causing the low voltage at D12/D13/R35)?

I'd like to test RL12, which is the relay for the power switch, too ... but can't get at the pins without taking the board out, which looks like it involves desoldering the SO-239; so waiting on that test.

thanks,
--david

: of 13V) ?

The pins connection, on the power cable side has a habit of getting loose and on both sides, oxidizing.

I used to clean mine with rolled up sandpaper and re-roll the cord side with a small screwdriver, eventually I replaced the molex style connector with a fiberglass plate with two stainless steel studs and connected the power with locking hardware. This solved the low voltage current problem and random disconnects when I hit bumps in the road.

I have some pics of my mod, it will take a while to find them, but I can upload to the group.

Kurt

Hi friends

i'm looking for a broken IC-706 (MK1) to be broken down as spares. please do contact me as im willing to make a reasonable price for the rig.

Thanks

# 18954. Lightening hit?

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-25 04:53:18 UTC
From: n4eyz
Topic: 18954  Message: 18954

706 MKIIG problem

We had a substantial electrical storm this afternoon. My 706G model was on desk powered off but all cables attached. Ant is ground mounted 5BTV properly grounded for lightening protection as well as 10' rod driven into the ground where cables enter the house although the coax is not grounded at that point. (A situation that will be quickly remedied--I should know better) Rig is grounded to that 10' rod.

Just as storm seemed to be getting too close for comfort (actually woke me from a nice afternoon nap!) I disconnected coax(s) from rig. Reconnected a short while ago (clear skies) and powered up radio. No audio from speaker but audio from headphones seems almost ok. Cooling fan now runs constantly--comes on with power up---previously ran only on tx and even then I don't think it ran wide open unless I got long winded. May be wrong on that part but just don't remember hearing it this loudly. There is a very loud whine from phones that I assume is from cooling fan--very nearly masks the rx audio. Tx seems unaffected in regards to power out and all control function inputs seem ok as well but difficult to know if all rx functions are ok until I can get this cooling fan issue straightened out. For giggles and grins I did a rig reset but to no avail. Same symptoms as before. A Bird 43 was inline on the HF side and a Diawa on the VHF/UHF side and both meters are unaffected. An Astron RS-35M on DC input and it's ok as well. If any have suggestions I'd sure love to hear 'em otherwise I need your advice on who to send this to for repair. My Icom repair skills are only surpassed by my knowledge and understanding of the fairer sex.

thanks!

Wayne/n4eyz

# 18955. Re: Lightening hit?

My first guess would have been the antenna but, if your meters are able to show a dip for the SWR, that obviously isn't it.

Next guess would be the coax from the rig. It could have chosen that time to go bad, maybe just from the handling of it.

After that ....?

God bless

# 18959. SWR meter behavior on USB

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-28 22:38:54 UTC
From: marklfriedlander
Topic: 18959  Message: 18959

I was operating on 2o meters and I noticed my SWR meter reading fluctuating.

Is it normal for the SWR reading on the meter built into my Icom 706MKIIG to vary between 1:1 and full scale when transmitting (with no audio) in USB?

When I switch the radio into RTTY mode and key the mic, the meter shows a solid 1:1.

Thanks,
Mark KV4I

# 18960. IC706MKII power supply issues

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-28 23:38:07 UTC
From: David Westbrook
Topic: 18960  Message: 18960

I have the IC706MKII that suddenly stopped powering on ... I had a thread here last week, and the suggestions were checking the connectors. Have checked out the connectors, and also gathered more diagnostic information that's showing odd behavior ...

The PA board (measured at D12/D13/R35 && the radio-side of the molex) is at ~3V instead of 13.8V that the power supply is at.

When the PLL board connector (J5 & J6) is disconnected, the voltage at D12/D13/R35 starts low and then climbs up towards 12-13V, at about ~1V/sec, slowing towards the end -- So basically behaving like a capacitor is charging.
This behavior is the same whether or not the main board (J2 & J4) is connected.
This behavior is the same with the astron power supply and with a car battery.
C82 looks ok from a visual inspection.

So there appears to be two issues ...
A) something in the PA board is causing it to get to the 13.8V very slowly, instead of immediately.
B) something in the PLL board is pulling the power supply's 13.8V down to ~3V
(i think it's possible that PLL is ok, and this is only happening because of (A), so maybe just one issue?)

Any thoughts on possible causes or next steps to investigate?

thanks!

That sounds like something they are known for on 15m. I would start by making sure all the circuit board mounting/ground screws are tight. No it's not normal.

David,
It sounds like you have a lot of resistance in the power supply to the radio. Can you measure the voltage right at the power connector (with the radio connected) and see what the voltage is there? Then check the first point you can reach inside as close to the power connector as possible.

with radio connected & PS on:
* PS terminals: 13.8V
* radio-side of molex: 2.8V
* first point (D12/D13/R35; in circuit diagram is direct to molex): 2.8V

PS cable has intact fuses on both lines.

power connector seems clean, and i sqeezed the female pins a little bit,
too. continuity is there from board to PS terminals.

thanks,
--david

# 18964. RE: [ic706] SWR meter behavior on USB

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-29 00:51:21 UTC
From: Warren, Edward F
Topic: 18959  Message: 18964

I had a similar problem that also occurred on 17m. It seemed fine with a dummy load - making me suspect the antenna. However, the radio was unstable - putting out a spurious signal somewhere near 22 MHz - which would have a high SWR on most any antenna (but not a dummy load of course). Loosening and re-tightening all the circuit board screws did resolve the problem. I also cleaned the spring ground connections to the case. When putting the covers back on - tighten the screws twice since the first ones you tighten will become looser as you go around the case. Good luck.

That sounds like something they are known for on 15m. I would start by making sure all the circuit board mounting/ground screws are tight. No it's not normal.

David
That clearly shows the connection is bad there, clean them well and make
sure they fit tight you should be good then.

# 18966. RE: [ic706] IC706MKII power supply issues

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-29 02:00:36 UTC
From: Saunders, Tom
Topic: 18960  Message: 18966

David, I think you have found your problem. There is a loss of voltage in the supply reaching the radio. You stated the fuses are intact. Are you checking them with an ohmmeter? How about with everything connected? What is the voltage at the radio side of the fuses? I have seen (more times than I can count) the white ceramic fuses measure OK with an ohmmeter, but very lossy when current is drawn through them.

# 18967. Re: [ic706] SWR meter behavior on USB

Yahoo group: ic706 (2010 — 2015)
Date: 2011-07-29 02:39:42 UTC
From: Mark Friedlander
Topic: 18959  Message: 18967

The plot thickens. Now, I'm seeing intermittent high SWR on 20 meters when I test using RTTY mode. SWR is low most time, then periodically, it tests high. Looks like my meter's good. I checked it against an external meter and saw the same intermittent SWR.

This problem just surfaced a week ago after months of trouble free operation. I'm guessing I'm going to have to go tighten up the clamps on my 6BTV vertical antenna.

Thanks,
Mark KV4I

That narrows it down to everyhting but the radio. Could be a bad power supply, connection at the supply, wire or molex at the and of the wire or on the radio.

I DID have an Astron supply do this once, 13.8 under no load, then even under a few hundred mA, suddenly drop to about 2.5 volts. I found a bad transistor inside.

What about oxidation on the connectors? I had a problem with this once.

Kurt

One thing to look for which happens on 15 and maybe 17 is I think a oscillation and when looking at a cross needle watt meter both needles go straight up. Hopefully tightening those clamps will help. Possible pl259 issue also.

# 18977. Icom 706mk2: No Mic power out.

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-09 09:17:58 UTC
From: rodbender2007
Topic: 18977  Message: 18977

Hi,
I have an Icom706 mk2 which has recently stopped transmitting audio on ssb and 2mtrs FM.

It works fine in digital modes,(I have made several contacts using psk31), but when using the mic there is no meter movement on ssb when talking or whistling into the mic. On monitoring 2mtrs there is a carrier but no audio. The tone burst can be heard on the repeater inputs.

I tried to use it in vox mode on ssb and the ptt is not latching at all.

I have tried both the original mic and my Heil Proset headset with the same results. I have also tried doing a factory reset but still get the same problem.

Any advice or help with this would be greatly appreciated.

Thanks
George.

# 18978. IC706MKIIG Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-09 13:50:21 UTC
From: g3vfp
Topic: 18978  Message: 18978

Hi guys

When powering up my IC706MKIIG we had a momentary power failure which mean the psu came on then off, then on again within a second or two.

The result was that there now seems to be a problem with the controlling micro. The radio sits there after switch on doing nothing, ie in a state of flux nothing working other than the fan runs. Then after an unplug of the dc supply and then switching back on it hangs in limbo making audiable bursts of tone like cw and eventually the display comes up, and everything appears to function normally. Until that is I power off again, and have to hope that the micro sorts itself out and it works. That is haphazard though.

Is there any common problem resolution like a regulator or micro reset component which may be the cause. Whilst it is in the state of limbo I have checked the input volts, and IC281 the 8V regulator (the only one I can get access to on the pll board without taking out the UT106 module) and that gives an output of 7.98V which appears fine.

Any thoughts welcome.

Cheers

Dave G3VFP

Try a CPU reset. Hold down the up and down buttons and then power up the rig.

Hi Wayne

That was my first action hi. If I power down and bring the rig back on then it simply sits there, and the only way you would know it had power is I can hear the relay click in, and the fan powers up. Other than that nothing. Then if I persevere so to say and unplug the dc supply leaving the radio switched on, it will go through only an audiable process of odd tones or low level noises, then eventually it springs into life with everything working. If I power off and try to power up to get into the main menu settings it won't do any other than I mentioned before. So it isn't a question of simply putting it back to factory default....I wish it was hi.

Cheers

Dave

From: david
Topic: 18985  Message: 18985

Hi all, I have a 706mk11g, the other day day my little grandaughter turned the power up on my power supply to nearly 30 volts. Not knowing this I turned the power supply on and the 706 got the full voltage and lots of thick smoke came from around the power socket, anyway I reset the power supply and turned on the 706 and it appears to work normally on all modes and bands etc. good job the 706 was not turned on with all that voltage present, well I am wondering what caused the smoke from the rear and should I have the 706 checked out?
Thanks all David.

Everyone should know that electronic components run on "smoke". You let the smoke out and it fails either immediately or eventually! :)

I would at least pull the covers to inspect. Something has obviously burned and even if it works fine now.....I wouldn't expect it to for long.

I just yesterday got my 706g back from being repaired for lightning damage. Mike Nadeau n1eq.com -- did a marvelous job on mine and is quick.

# 18988. RJ45 mic jack question

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-10 14:10:32 UTC
From: John Geiger
Topic: 18988  Message: 18988

I see from the manual for the Icom 706 original that the AF out audio is available from the mic connector, much like it is from the ACC connector. The manual doesn't state, though, if this audio is fixed level or controlled by the AF gain. Does anyone know this? I am trying to come up with a simple AFSK/digital interface using only the mic connector (and VOX). Has anyone designed one this way, or know of commercially available products using the mic connector for both audio in and out?

On my mk2g the traveller headset gets rx audio from the plug and I have tapped that to a dsp filter. It is adjusted by the af gain control.

Hi guys

thanks for your considered input. I found the problem today. Moved the audio dsp pcb out of the way so I could get at IC291, and IC271 on the PLL board.
The problem turned out to be the TA7805F 5V regulator. I replaced it
with a chassis mounted 7805 which I fitted on the case side wall, and all working fine. How the 7805F ever received adequate heat sinking from the pcb ground plane who knows!.

Regards

Dave G3VFP

John, what I did since the 706 has two mic jacks is to purchase a computer patch cord with rj 45 and spliced in to the audio line to go to my mfj tunable dsp audio filter.

# 19006. FL101 and RTTY

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-14 14:18:08 UTC
From: John Geiger
Topic: 19006  Message: 19006

I currently have the FL100 installed in my Icom 706 original (the model with 1 filter slot) and it does a pretty good job, but would also like something a little narrower. I have found a good deal on the FL101 250hz CW filter. I also hope to start running the 706 on RTTY soon. Will a 250hz filter work with RTTY? I know that RTTY uses a 170hz split which should work, but is 250hz a little too narrow to adequately tune around for RTTY signals? I will be using AFSK, not true RTTY, if that makes a difference.

From: Ralph Mowery
Topic: 19006  Message: 19007

The 250 hz filter will work fine on rtty as far as the band width.  I think you may run into one other problem if you try to use the AFSK with that filter.  It has been several years ago that I had a 706 with the 350 or whatever hz filter that was so I may be remembering wrong.  It sets the tones below 1000 hz that will pass through the filter.  I think you can fool it  by telling the menue that you hae another type of filter installed. Mine was the mk2G so it may act differantly.  When running the afsk for rtty you need to have the tone pair set for atleast 1500 hz for the mark tone.  This helps with the harmonics that may be generated when using the afsk for rtty.

The narrow band width will make it somewhat difficult to do fast tuning around for rtty, but once you find the signal, it will be wide enough.

# 19009. Digital modes interface using mic connector

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-15 13:17:47 UTC
From: John Geiger
Topic: 19009  Message: 19009

Does anyone know of commercially available soundcard interface using the mic connector for both audio in and out? I can find a few that use the mic connector instead of the ACC connector for the audio to the rig, but they still use the speaker connector for the audio to the computer. I would like to do everything with 1 cable (and 1 conntection to the rig) if possible.

Why use the mic socket? The data connector is made for the job. Do you have a specific need to use the mic socket, like using the rear connectors for the ATU or amp?

Tom,

I have a MK2 and a MK2G; the MK2 does not transmit on any band; went out intermittently.

Do you have a link to the manual? Could not use this one.

I was told that the output stages has been changed between models and the MK2 is not repairable; is this true? Was not told this by anyone who is an authorized repair person.

Thanks in advance...

Tony

Tony,

You can download it from Rigpix, on the bottom of this page. Both the user and the service manual.

http://www.rigpix.com/icom/ic706mkiig.htm

You can find the IC-706 manual here

http://www.repeater-builder.com/icom/pdfs/icom-ic-706-service-manual.pdf

Look here for the manual:

http://www.cqham.ru/sch_eng.html

From other postings, the output transistors are difficult to come by for one version of the power amps for the 706.

# 19016. 706MK2G Won't tansmit on FM mode

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-15 15:15:35 UTC
From: Rick
Topic: 19016  Message: 19016

I have a 706 MK 2 -G that works great on all modes AM,USB,LSB, and AM.
But when I select FM on the mode switch and key up the rig on any FM band like 10,2,6, or 440 MHZ it does not put out any audio.
I thaught I lucked out and found the fix on DK.mods web site.Someone was having the same problem and reportded it to ne bad solder joints on the FM trimmer capactor. They had a good picture and step by step instructions on finding the trimmer and where and how to resolder the legs to the PCB. I took the top cover of my rig off and was unable to find and identify the suspected trimmer cap. I am assuming that the problem is that the rig shown in the illustration was different than mine, perhaps a older IC 706 (not MK2) that has the board laid out different.
If anyone has had this problem and can recomend how to fix it please let me know.
Thanks in advance Rick ND4Z

What I am using is CAT5 cable, and the back mic connector. I used the green pair for the speaker out(radio) to mic in(laptop) and the orange pair for the speaker (laptop) out. I have to run to PC volume very low, but I have made several contacts with this set up. You may need an audio transformer (1-1 I think) on the laptop input.

John,
that is a function of the radio, the radio you have may not have the audio in the mic.

Hello John,

I've been working lately to interface my 706mk2g for Asterisk/Allstar. I just posted the following to another group, so I'll repost it here:

I've learned a little from the experience of interfacing the 706.. For example, the app_rpt help page
http://images.ohnosec.org/ic706.pdf shows two connections from the PC to the 706 (RJ45 mic and packet jack). This was done for a couple of reasons:

* The rear RJ45 and packet jack require about 25 mA to key PTT. The front RJ45 requires much less, so an opto will actually key the radio from the front jack.

* The rear ACC jack and packet jack provide a fixed RX audio, where the RJ45 jacks do not.

* It IS possible to use a single cable on the packet port to the PC. You will need to key PTT via a transistor or relay, not directly from an opto.

* Setting the 706 to 1200 baud packet mode routes TX audio through the pre-emphasis circuit. 9600 baud does not.

73 for now,

Kyle
K0KN
Olathe, KS

Topic: 19009  Message: 19023

Is the schematic on that webpage below for the IC-706 (original), the IC-706MKII, the IC-706MKIIG, or for ALL versions of the 706?

It does not specify that I can see.

Subject: [ic706] Re: Digital modes interface using mic connector

Hello John,

I've been working lately to interface my 706mk2g for Asterisk/Allstar. I just posted the following to another group, so I'll repost it here:

I've learned a little from the experience of interfacing the 706.. For example, the app_rpt help page
http://images.ohnosec.org/ic706.pdf shows two connections from the PC to the 706 (RJ45 mic and packet jack). This was done for a couple of reasons:

* The rear RJ45 and packet jack require about 25 mA to key PTT. The front RJ45 requires much less, so an opto will actually key the radio from the front jack.

* The rear ACC jack and packet jack provide a fixed RX audio, where the RJ45 jacks do not.

* It IS possible to use a single cable on the packet port to the PC. You will need to key PTT via a transistor or relay, not directly from an opto.

* Setting the 706 to 1200 baud packet mode routes TX audio through the pre-emphasis circuit. 9600 baud does not.

73 for now,

Kyle
K0KN
Olathe, KS

--- Original Message ---

Does anyone know of commercially available soundcard interface using the mic connector for both audio in and out? I can find a few that use the mic connector instead of the ACC connector for the audio to the rig, but they still use the speaker connector for the audio to the computer. I would like to do everything with 1 cable (and 1 conntection to the rig) if possible.

I think it is the same for all models of the 706.

John;
I cant figure out where your question went, but I am not using the transformer in my set up. It may be an advantage to use it, but I havent tried yet. I have Germany, France, Canary Islands, all on about 23 watts. I run an 11a power supply for now. Until I can afford to upgrade, thats the highest power I have used. Go ahead and e-mail me direct (kb9mnm@...) if you have any more questions.

You can order a Signalink with a RJ45 cable and that should work, but I'd check with them first.

Hi John,
The nice thing about using CAT5 is that its all prewired. Just follow the schematics to figure out which wires go where. I used Radio Shack mono audio jacks for my laptop.
Hope it all works out for ya and keep me posted.
73's!

# 19028. Mic up-down button

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-29 19:33:38 UTC
From: wa0hpn
Topic: 19028  Message: 19028

Just picked up a IC-706MKII at the ham-fest in Fargo ND. All works well in my mobile, except for the up down button on the Mic.

I tried the mic in another installation (WB0SWW's) and the up-down worked. In my install I have the control head remoted, and tried the mike in both the control head and the back of the transceiver, neither worked on the up/down. Any ideas???

The keyer function has been changed from paddles to the UP/DOWN buttons. You can verify this by going into CW mode and seeing that it sends CW with the up/down buttons. To change it back, while in CW mode, press and hold the DISP button. This brings up the quick menus. Go to Q4 and change it to "n".

I don't know what type mike you have. If it is the HM-103 , there is a little switch between the up and down switch to lock the up and down function

# 19033. My 706 will not power up

Yahoo group: ic706 (2010 — 2015)
Date: 2011-08-30 23:47:59 UTC
From: n4dou
Topic: 19033  Message: 19033

Hello all

My 706m2g will not power up. No relay sound when I connect it to the power supply. Good voltage is getting to the circut board. No corrosion to the HV trace under the PLL board. Everything was connected on the circuit board and no screws were loose.

I used the rig at Field Day with no problems. I pulled it out of my go kit and would not power up. The power supply checked fine (astron).

Any ideas would be appreciated. I have searched this forum and searched google and nothing has helped.

Tnx

Check and clean the connection pins both on the faceplate and the radio side. I polish mine occasionally with q-tips and rubbing alcohol, 70 or 91 per cent, depending on what I have. Also, check to ensure the faceplate is seated properly on the radio body.

Are you using the control head hooked directly to the radio or via the remote cable? If via the remote cable try it direct and clean the contacts on both sides before plugging it together.

Is it also true to say "the voltage is getting to the board and does not drop significantly (on a scope) when attempting to power up" just in case the power to the board is good for only half an amp.
I believe power pins can often get loose and assuming things were mated/disconnected due to the field day a bit of connector tweaking could be a good start. There are also those chokes close to power connector the that can be disturbed but I bet that is covered by your mention of checking traces.

John,

Look at the top of this page. This is what happened with my IC-706MkIIG.
After what I have heard, it is not a rare occurrence.

If you look on through old messages, you will see that this issue have been
discussed before.

Look at this file. It shows you possible problem areas

Good luck.

Subject: [ic706] My 706 will not power up

Hello all

My 706m2g will not power up. No relay sound when I connect it to the power
supply. Good voltage is getting to the circut board. No corrosion to the HV
trace under the PLL board. Everything was connected on the circuit board and
no screws were loose.

I used the rig at Field Day with no problems. I pulled it out of my go kit
and would not power up. The power supply checked fine (astron).

Any ideas would be appreciated. I have searched this forum and searched
google and nothing has helped.

Tnx

John

Thanks to all who replied to my post. I am happy to say that my 706 is working fine now. I cleaned the contacts on the face and the main body. When I removed the PLL board I removed the two pads that have been associated with corroding traces on the board. I spoke with with Matt at Icom in Michigan and he told me that he removes those pads.

# 19039. IC 706 MK2: No mic audio power.

Yahoo group: ic706 (2010 — 2015)
Date: 2011-09-12 10:50:05 UTC
From: rodbender2007
Topic: 19039  Message: 19039

Hi,
I have an IC706 MK2 which has suddenly stopped transmitting audio power.
The mic's key the radio ok but there is no power displaying when transmitting audio.
I have the standard fist mic as well as a heil proset headset. The same thing is happening with both mic's.
Everything works fine on digital modes. I have tried a factory re-set and both mic sockets without success. I would suspect the mics but two going at the same time would be a big coincidence. Any ideas as to what the problem might be will be gratefully received.

Cheers
George (G0RLF).

Have you gone in the menu and checked the Mic gain?

: The mic's key the radio ok but there is no power displaying when transmitting audio.

Is your radio actually set to display power? Maybe it's set to ALC or SWR? Can you hear yourself on a radio when you transmit and talk into the microphones?

Kurt

Hi Kurt, all the settings are correct and no I can't hear anything when monitoring HF or FM. It works fine in data modes such as PSK though.
I do suspect it's a mic problem but it just seems such a coincidence that both mic's should pack up at the same time.

Yes I've done all the normal tests and checks. That's why I'm looking for ideas on here, I've exhausted my knowledge of the radio. Thanks.

Have you checked that the voltage supplied to the electret element is present?
I think (at work nothing in front of me) that they mention 8V is on one of the mic pins and not to accidentally short it as it will take out the voltage regulator.
I suppose one or more of the the up/down buttons would not work if they needed that too.
A dynamic mic might be a valid test if you can connect easily.

Stu

Are they both Icom mics?  They require power from the radio to function correctly.  Check the 8V line to see if there's power there.

Joe, N3JI
